of 68/10 or 40/10.

### BOLEX C916 PROJECTOR

For both 9.5-mm. and  
16-mm. films.

This machine is entirely  
gear driven, there being  
no belts whatever. When  
fitted with a 50-volt  
200-watt lamp and the  
equivalent of a three-  
bladed shutter, the  
screen luminosity is  
130 lumens.

**£46**

Nine monthly payments  
of 45 7s. 4d.

### ENSIGN MAGNAPRINT

Super-speed condenser enlarger for  
Ensign Midget, half-V.P., Leica and  
other similar size negatives. With  
combined condenser, diffused light  
system, making for speed, fine definition  
and contrast. Gives rapid exposures,  
2 secs. for 2 1/2 x 3 1/2, 8 secs. for 4 x 5,  
15 secs. for 5 x 7 in. Metal throughout.  
Ensign f/6.3 enlarging anastigmat.  
Chart giving all sizes up to 15 x 12 pro-  
vided on baseboard. Com-  
plete with all-electric fit-  
tings (without lamp).

**£4:10:0**

3 1/2 x 2 1/2 size, £7:10:0

## For Miniature Camera Negatives "PRAXIDOS"

AUTOMATIC FOCUSING VERTICAL ENLARGERS

The PRAXIDOS makes it possible  
to obtain enlargements of uniform  
sharpness over the whole scale of  
enlargement. No final focussing  
by hand, no faulty results caused  
by unsharpness. Enlarging is done  
as quickly and easily as contact  
printing.

No. 502 PRAXIDOS gives 2 to 10 times  
enlargements from Leica, Contax, Retina,  
also Pilot, Kolibri and Pupille negatives,  
and all sizes up to 4 × 4 cm.  
Price, with f/3.5 anas-  
tigmat lens. £17:10:0

No. 506 PRAXIDOS gives 1½ to 7 times  
enlargements from any negative up to 6 × 6  
cm., i.e., Rolleiflex, Rolleicord, Superb, etc.  
Price, with f/3.5 anas-  
tigmat lens. £18:0:0

No. 491 PRAXIDOS gives 7 times enlarge-  
ments from 3½ × 2½ in. or smaller negatives.  
Price, with f/3.5 anas-  
tigmat lens. £24:0:0

Nos. 498 or 499 PRAXIDOS  
gives 2 to 10 times enlargements  
from Leica or Contax negatives,  
made for use with Leica or Con-  
tax lenses of 5-cm. focus.  
Price, without lens £12:15:0

VOL. LXXX. No. 2442.

**R**EADERS who are proposing to submit work to the London Salon of Photography this year are reminded that the last day for receiving pictures at the gallery (5a, Pall Mall East, S.W.1) is Wednesday next, September 4th. Packages should be addressed to the Hon. Secretary, London Salon of Photography, at that address, and those forwarded by post can be sent at any time before that date; but parcels will be received when delivered personally by hand up to the evening of September 4th. Both the London Salon of Photography and the Royal Photographic Society's exhibition open on Saturday, September 14th. The private view of both shows will be on Friday, September 13th. In the case of the Salon this is held from 3 to 6 p.m., and in the R.P.S. it is held during the evening.

### Graininess in Emulsions.

Owing partly to the cinema, but partly also to the greatly extended use of the small camera and the considerable enlargement, a great deal of attention has lately been devoted to the reduction of grain in emulsions. Mr. Olaf Bloch, who speaks with authority on this subject, gave an inkling to the Royal Photographic Society recently of some of the work which has been done behind the scenes on this vexed question. Everyone who has ever studied a newspaper reproduction or been near the screen in a picture theatre or looked at enlargements from small negatives is aware of the difficulty. The emulsion-maker's art during the last five or six years has been much exercised over this problem, and the research has led to a great deal of very interesting

## TOPICS of the Week

### A Weather Forecast

FOR THE WEEK

By D. K. BARTLETT.

#### THURSDAY, AUGUST 29th.

The weather will be less settled and a break-up after the warm, fine weather. There will be less haze and a clearer atmosphere, also thundery conditions will cause cloud to take off the glare, which has been common during the heat-wave.

#### FRIDAY, AUGUST 30th.

Varying types of weather conditions will be usual. Heavy thunder clouds, short periods of sunshine, and a steady breeze will keep the atmosphere clear of mist and haze.

#### SATURDAY, AUGUST 31st.

The temperatures will increase and somewhat warmer and brighter weather will come in again for the week-end with the heat being excessive. Some cloud will occur over the Midlands and West, but it will remain fine.

#### SUNDAY, SEPTEMBER 1st.

The first day of September will be fine and fairly warm for the time of the year. Photographic work will be easily carried out under quiet, ideal conditions, while parties should take advantage of this good weather, as rain will occur during the next week-end.

#### MONDAY, SEPTEMBER 2nd.

The fine and sunny weather will be general, occasional cloud will all be to the advantage of the photographer. The evening will be somewhat disturbed in the Western half of England.

#### TUESDAY, SEPTEMBER 3rd.

Mainly fine weather with warm temperatures for the time of the year, and a damp mist or hazy conditions are probable in places.

#### WEDNESDAY, SEPTEMBER 4th.

Similar weather with a fairly clear and bright sky; temperatures are likely to be above the average again, from the South-East through the Midlands to the North.

and important work being done in extending the knowledge of emulsion principles and practice. It has become more or less a routine with some emulsions to double-coat so that in the first place the amount of the coarser-grained emulsion, which is the high-speed emulsion, is reduced, and a fine-grained emulsion is got in the under-coat. As the amount of emulsion on the film or plate is reduced its power of building up density is naturally lessened, so that when an emulsion of that kind is duplicated the under-emulsion is so regular that it picks up the exposure from the top emulsion just where the top emulsion begins to fail, and carries it on.

### A Dark-room in the Tropics.

Tribulation in a dark-room during a photographic expedition to West Africa is amusingly described in a book lately published, entitled, "Behind the Camera." The author, Mrs. Barkas, says truly that the man who loads the magazines, packs up the exposed negative, and sends it home for development is an unrecognised hero. One hears much of what is done with the camera in difficult situations, but not so much in the dark-room interior, the door shrouded with grass mats and black cloth. As likely as not the worker may find that a colony of super-ants have taken up their abode there. Inevitably several of them are crushed underfoot, and as they are of the variety known locally as "stink ants," a most intolerable smell immediately pervades the stifling atmosphere. But the worker must not retreat while he uncovers a thousand-feet reel of exposed negative, and from the end clips off a length of eight inches for test development. Then a squadron of

very large hornets may descend on him from the grass roof. To open the door and leave things while uncovering a length of raw stock and making the change over might cost the expedition many hundreds of pounds. Nor must he hurry over the unwinding of the reels or friction may cause electrical discharges on the film. And, again, he must not bungle, for the delicate film, surface is easily damaged by excessive handling. And when at last he does emerge from, it may be, an hour's horrible captivity, he is very likely to say, with the greatest nonchalance, that the conditions were pretty bad, but that he has had far worse times changing beneath an improvised tent of blankets in hotel bedrooms at home.

### A Genius of what is.

We have been reading again that remarkable "collective portrait" of Alfred Stieglitz published in New York last year. The idol indeed is worthy of all the incense which the two dozen writers bring to his shrine, but some of the incense is of unusual odour. Take, for example, the chapter by Jean Toomer, who almost becomes lyrical in telling us

how Stieglitz sets to work. For a time he sits silent, pensive. "I wondered when he would begin photographing. . . . In due time he began. . . . A natural happening. His working *tempo* was but a quickening (though what a quickening!) of his usual *tempo*. . . . No casual observer would have thought that anything 'great' was going on. His camera was in evidence. Out he would go with it. In he would come. And soon the large table in the front room was filled with his material and his prints. It was that simple—and that real." As to the results of his work, the same writer speaks of the treeness of Stieglitz's trees, the stoniness of his stone, the woodiness of his wood, and the fleshiness of his flesh. "Here in these prints are the earth as it is, our dwellings as they are, we humans as we are. If I were commissioned to travel through space and inform the beings of some other planet on the nature of this earth-part of the universe I would take Stieglitz's camera works along." But why should the fact that Stieglitz is "a genius of what is" be the reason given why he will never use a moving picture camera?

### A Face for a Lifetime.

Old Thomas Browne, the Norwich physician, said that it was the common wonder of all men that among so many millions of human faces there should be none alike. But there is another source of wonder, come to think of it, that the same face should be recognisable right through a lifetime, so that even in the photograph of the boy something of the lineaments of the middle-aged man can be recognised. The other day the writer of these lines discovered a photograph of a school group of about thirty boys taken when he, a member of the group, was twelve years of age. He is now well in his sixth decade, yet on showing that photograph to a circle of recent acquaintances, none of whom had known him in early life, they all unerringly picked him out. And that after not far short of fifty years! It should be added that he has no physical peculiarities, being merely one of those plain people whom Abraham Lincoln said the Almighty must love because He had made so many of them. But what a distinctive face He has given to every one of them! Literally a case of infinite variety!

## READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with on this page week by week. Other replies appear as usual on the last page.

### Botanical Work.

*I intend to commence almost at once on the photography of wild flowers and plants in situ. I have done some ordinary "snapshooting," but realise that the nature work is a very different proposition. Can you give me a hint or two on the most suitable apparatus, etc.?* G. H. N. (Taunton.)

The most successful workers in this particular branch of photography differ considerably in their choice of apparatus, and in some respects there is latitude in selection. At the same time the conditions of the work suggest limitations of choice.

For example, there is difference of opinion as to appropriate size of negatives; but we see no need for the bulky half-plate cameras still favoured by a few. Unless stereoscopic results are wanted, we should ourselves decide on quarter-plate or  $3\frac{1}{2} \times 2\frac{1}{2}$ . Contact prints are large enough for examination, especially with a glass, and enlargements of any required size can of course be made.

We regard a focussing screen as essential. As most of the subjects will be close-ups, it is important to see that everything required is properly included, and that the focussing (generally differential) is exactly as it should be. The character and distribution of definition is also important, and this can be successfully studied only on a full-sized screen.

It is also evident that the camera should have "double" extension. This makes it possible to focus at very close quarters; and where natural-size photographs are required the extension must be double the focal length of the lens.

As to the lens itself, the focal length may very well be about

equal to the diagonal of the negative. Although considerable stopping down is generally necessary in this work, a full aperture of, say,  $f/4.5$  is advisable for arranging and focussing the subject, especially in weak light.

Although sunlight on the subject is often an asset, it is liable at times to give spottiness, confusion and over-contrast; and a good diffused light is often preferable.

Dark slides have much to recommend them, especially as plates of different grades and character can be carried if necessary, with an indication on the outside as to the contents. Film-packs are also convenient. In any case, however, we should advise the general use of panchromatic material, with at least one filter available when required.

Another indispensable accessory is a tripod, and this must be of a type that is capable of supporting the camera in a low position. A stout metal telescopic model is as good as any, as it can be used without extension, or with several progressive extensions, according to requirements. A large focussing cloth should also be provided.

Although not actually necessary it is certainly an advantage to have available a shutter of the everset type to fit on the front of the lens. With this a continuous exposure of any length can be given, but what is more important is that it is possible to give a series of intermittent exposures. This is valuable when there is movement in the subject due to wind, short exposures being given at periods of rest until the total amounts to the full exposure time required.

With an outfit more or less on the lines suggested, the finest results become a question only of care and experience.

# After the Holiday

## A note on the development of negatives

The following article is addressed to the photographer who returns home with a number of plates or films awaiting development. Hints are given as to limiting the number dealt with at one time, and other factors which need consideration.

THE photographer who returns home with a good number of exposed plates or films awaiting development is in the happy position of being able to continue the delights of the holiday. There is the pleasure of seeing again the scenes and incidents of the holiday, and there are probably some exposures which it is hoped will result in pictures which will grace the walls of photographic exhibitions during the coming winter. It sometimes happens that many good negatives are spoiled through lack of attention to certain essentials which are dealt with in this article.

### Batches.

The photographer who is accustomed to develop one or two plates, the contents of a film pack, or a single roll of film at one time, will be well advised to confine himself to the same number at once, when dealing with holiday exposures. He will probably find that his equipment is insufficient to deal with large batches of negatives, and if the number in hand at one time is too large, the results are almost certain to be defective in one respect or another. Many workers overlook the fact that while the development of one or two films or a dozen plates takes but a very short time, there are other operations to follow, and if these are to be properly carried out, time, space and equipment are necessary, if the negatives are to be free from defects, and permanent. It follows that if too many are developed at once congestion will occur, either in the fixing-bath or during washing, with the consequent risk of damage or ineffective treatment at one or other of these important stages. Further, the photographer will probably find that his equipment is insufficient to deal with larger numbers than those normally in hand.

This is especially important in these days of small sizes, when large numbers of exposures are made. It is admitted that these take up less space when "processing," but it is very necessary to see that each is as perfect as possible, or the results will be disappointing. Although the photographer will be naturally anxious to see the results of his exposures, he is strongly advised to resist the temptation to attempt the development of too many at one time.

### Procedure.

It is strongly advised to conduct operations in the same manner with which he is familiar, and not to attempt experiments with developers or methods of development, with plates or films which represent exposures which cannot be repeated. The use of a developer with which the photographer is unfamiliar may mean that through being unaware of its peculiarities, the results may be less satisfactory than with an old and tried friend.

### Solutions.

It is a good plan as a preliminary to development to see that there is plenty of fresh developer and fixing solution available. In the case of those photographers who employ the ready compounded developers this is easy. Those who compound their own should start with a fresh supply. The fixing solution, either plain or acid, should also be prepared, in generous quantity, in order to avoid any risk of imperfect fixation, through overworking the bath. Experience teaches that this is a very common cause of failure.

### In General.

Most photographers prefer to develop all their exposed plates or films, and to proceed with the printing. They will by so doing know

how their results have turned out. Intensification or reduction should not be necessary, in these days of bromide or gaslight papers of such range of contrast, but if it is thought necessary to apply one or other of these in order to compensate for error in exposure or development to suit the needs of some particular printing process, the best time to do so is immediately after washing. The photographer can then be sure that the fixing and washing are properly done, which is very important, especially if intensification is determined upon. This also avoids the risks attendant upon re-wetting a negative after it has been dried. After drying, the negatives should be spotted, and sorted into batches, of the same degree of contrast, so that proof prints may be made upon the same grade of paper.

### Making Proofs.

All the negatives should be printed. Some photographers print those that seem to be the best, and discard the others, but the photographer who has made exposures upon subjects new to him cannot judge the results by negatives alone. It is possible that negatives which may seem disappointing will produce good prints. In the case of small negatives, i.e., those smaller than  $3\frac{1}{4} \times 2\frac{1}{4}$  it is recommended that small enlargements should be made of, say, half-plate size. These will enable the photographer to estimate the possibilities of individual subjects, and the making of the final prints may be proceeded with.

He will indeed be an unlucky photographer who does not find at least a few first-rate subjects among his holiday negatives. Some of these are obvious at once, but it often happens that a really good thing may be overlooked in the first rush, and is only discovered later.

# ILLUSTRATING THE LOG-BOOK

By WM. A. BAGLEY.

A novel way of mounting holiday snaps.

SUMMER holidays are now drawing to a close, and remain, for most of us, pleasant memories, thanks to the dozens of photographs we took. During the longer evenings, when we have time to spare, the more careful of us will be busy putting the snaps in albums. It is only when we have carefully mounted a hundred or so pictures in a book that we begin to fathom the meaning of the saying, "You can't see the wood for the trees." The kind friend who is looking at our masterpieces finds his interest waning after thumbing over pages and pages of prints mounted with geometrical precision, no matter how well the snaps were taken.

The writer, being an inveterate hiker, records all his travels in a log-book, as all tourists—walkers, cyclists and motorists—should do. It would be out of place, in this paper, to give details for making, compiling, and keeping a log-book, but it might be explained that the log is a large book in which are recorded distances, weather notes, accommodation, finance, general impressions, etc., and preferably with a sketch map. This latter need not be elaborate—being merely sufficient to show the general direction and lie of the land. It is around this map that photographs taken *en route* might well be mounted in the appropriate positions. In this way, we shall be able to show the photographs in relation to one another in a way calculated to interest the casual viewer.

Of course, only the smaller snaps can thus be utilised, but tourists rarely carry large cameras. It is a good plan to have the best enlarged and use

them in the manner of full-page illustrations. This adds variety to the book. Snaps of people—wayfaring companions and the like, will not, of course, be mounted on the map, but on a separate sheet in the usual way.

aims. Naturally they will not suit everybody, but they can easily be "moulded nearer to the heart's desire" according to requirements. It is the fundamental idea to which attention is drawn.

Motorists and cyclists on tour, whose route covers several hundreds of miles, may find the sketching of a map rather too much trouble. In this case, the route can be marked in ink on a cheap map, and the prints mounted alongside it. The map can be cut out into pages to suit the size of the log-book, if the map is not already in page-form.

These are merely hints as to the writer's own procedure—the methods that happen to suit his own ideas and

No doubt there will be those who, in addition to their photographs, produce sketches in pencil, pen and ink, water-colour and so on; and these can be advantageously included, provided they are so arranged as to harmonise and not clash with each other.

There are some who supplement their holiday snaps with purchased postcards and local views, but in the circumstances these are generally best kept separate.

## The Week's Meetings

### Wednesday, August 28th.

Rochdale P.S. Hints on Making Dark-room Appliances. H. H. Stansfield.  
Stockport P.S. Competition.

### Thursday, August 29th.

Hammer-smith H.H.P.S. Discussion on One-Man Show. J. Staples.  
N. Middlesex P.S. Modifying the Negative. Messrs. Searle and Welsh.

### Friday, August 30th.

Wimbledon Ciné Club. Programme of Films.

### Saturday, August 31st.

Dennistown A.P.A. Ardgowan Estate.  
Hanley P.S. Croxden Abbey.  
Hull P.S. Kilnsea and Spurn.  
Luton and D.C.C. Ivinghoe Beacon.  
Nottingham and Notts P.S. Newtown Linford.  
Sheffield P.S. Monsal Head and Ashford.  
Southampton C.C. Balmer Lawn.  
Walthamstow and D.P.S. Caterham Valley. Meet at London Bridge Station, 2 p.m.  
Worthing C.C. Dyke to Poynings.

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

### Sunday, September 1st.

Leigh Lit. Society P.S. Southport.  
North Middlesex P.S. Hemel Hempstead and Water End.  
York P.S. Flamborough and Thornwick Bay.

### Monday, September 2nd.

Luton and D.C.C. "What Paper shall I Use?"  
Southampton C.C. Informal Meeting.  
Walthamstow and D.P.S. Print Competition.

### Tuesday, September 3rd.

Hackney P.S. "The Borders of Epping Forest." Harold Rose.  
Leicester and L.P.S. Talk by T. Ward.  
Nelson C.C. Lantern Slide Spotting and Binding.

### Wednesday, September 4th.

Rochdale P.S. Discussion on Developers.  
Stockport P.S. "Figure Studies." Miss Kate Smith.  
Worthing C.C. Washington to Sullington.

## Speed

The speed of the Pernox is 26° Scheiner, 16/10° Din., or 2,700 H. & D. Speed is, of course, not the only quality in a film, but when, as is the case with the Pernox, it is combined with extreme fineness of grain, the ideal for which film manufacturers have sought has been obtained.

## Latitude in Exposure

The speed of the Pernox makes under-exposure very rare. Over-exposure in bright light is more likely, but good Pernox negatives can be obtained even with five or six times the correct exposure.

## Uniformity

In a good film the quality of the emulsion or base should not vary. The Pernox is not good sometimes; sometimes indifferent; it is uniformly good every time. You can rely on Pernox.

PERNOX PANCHROMATIC has now been introduced. Sensitive to all colours of the spectrum, it gives correct monochrome rendering of colour, provided a suitable filter is used.

# PERNOX

## ROLL FILMS

### PANCHROMATIC and ORTHOCHROMATIC

ZEISS IKON LTD., 11, Mortimer House, Mortimer Street, London, W.1

# ENGLAND'S LARGEST SELECTION OF MINIATURE CAMERAS

Every miniature camera of distinction is to be seen at our showrooms, including, of course, all the newest arrivals in the world of miniature photography. Besides new cameras, we have, however, an enormous choice of second-hand apparatus, with each of which we give a guarantee of mechanical and optical perfection.

Here are a few of them :

### LEICAS :

Leica Model IIIa, chromium, f/2 Summar, ever-ready case. As brand new.....	£35 0 0
Leica Model III, chromium, f/2 Summar, ever-ready case. As new.....	£31 0 0
Leica Model III, chromium, f/3.5 Elmar, ever-ready case. As new.....	£25 0 0
Leica Model II, f/2 Summar, ever-ready case. As new.....	£25 15 0
Leica Model II, f/2.5 Hektor, case. Good condition.....	£21 0 0
Leica Model II, f/3.5 Elmar, ever-ready case. Good condition.....	£18 0 0
Leica Model II, as above, but brand new condition.....	£19 10 0
Standard Leica, f/3.5 Elmar, Fokos range-finder. As new.....	£12 12 0
Standard Leica, f/2.5 Hektor, Fokos range-finder. As new.....	£15 0 0
Leica Model I, f/3.5 Elmar, case. Good condition.....	£7 15 0
Leica 3.5-cm. Elmar f/3.5 Wide-angle (coupled). As new.....	£6 10 0
Leica 9-cm. Elmar f/4 Telephoto (coupled). As new.....	£8 5 0
Leica 7.3-cm. Hektor f/1.9 (coupled). Good condition.....	£16 10 0
Leica 13.5-cm. Hektor f/4.5 Telephoto (chromium, coupled). As brand new.....	£13 15 0
Leica Universal Finder. As new.....	£3 0 0

### LEICAS—contd.

Leica 10.5-cm. Elmar f/6.3 Telephoto (coupled). As brand new.....	£7 15 0
Dallmeyer 4-in. f/5.6 Telephoto, for Leica.....	£3 10 0
Leica Figro Filter, 12/-; Fipos Filter, 15/-; Fhrad Filter, 16/-; Fimoo Filter, 12/-; Fioc Filter, 12/-; Fbxoo Filter, 15/- (all as new in leather purses).	
Leica Enlarger, original model fitted Leitz lens. Good condition.....	£6 0 0

### CONTAXES :

Contax, slow-speeds model, f/2 Sonnar, ever-ready case. As new.....	£28 17 6
Contax, latest slow speeds model, f/2.8 Tessar, ever-ready case. As new.....	£23 10 0
Contax, latest slow speeds model, f/3.5 Tessar, ever-ready case. As new.....	£21 10 0
Contax Model A, 1/25th to 1/1,000th, f/2 Sonnar, ever-ready case. New condition.....	£19 0 0
Contax Model A, as above, but with f/2.8 Tessar.....	£19 0 0
With f/3.5 Tessar.....	£17 15 0
Contax Magniphot Enlarger. As brand new.....	£7 0 0
Contax, 3½-in. Long-focus f/2 Sonnar. As new.....	£27 0 0
Contax, 13.5-cm. Sonnar Telephoto. As new.....	£14 5 0

### ROLLEIFLEXES :

Rolleiflex, 1935 model, 6×6, f/3.5 Tessar, Rapid Compur, ever-ready case. As brand new.....	£18 0 0
---	---------

### ROLLEIFLEXES—contd.

Rolleiflex, automatic, 6×6, f/3.8 Tessar, ever-ready case. Perfect condition.....	£15 15 0
Rolleiflex, automatic, 4×4, f/2.8 Tessar, case. As brand new.....	£16 10 0
Rolleiflex automatic, 4×4, f/3.5 Tessar, ever-ready case. Perfect condition.....	£13 10 0
Rolleiflex, non-automatic, 6×6, f/4.5 Tessar.....	£7 10 0
Rolleicord, f/4.5 Triotar, case. New condition.....	£8 0 0

### SUPER IKONTAS :

Super Ikonta, very latest model 530/16 (takes 11 pictures on 3¼×2¼ film), f/2.8 Tessar. As brand new.....	£22 0 0
Super Ikonta, 530/2, f/4.5 Tessar, latest Rapid Compur, case. As brand new.....	£15 10 0
Super Ikonta, as above, but fitted normal Compur.....	£13 10 0

### EXAKTAS :

Multi-speed Exakta, f/2.8 Tessar, universal case. As brand new.....	£19 17 6
Multi-speed Exakta, f/3.5 Tessar, 2 filters, lens hood, ever-ready case. As new.....	£16 10 0
Exakta Model A, f/2.8 Tessar, ever-ready case. Perfect.....	£16 10 0
F/1.9 Dallmeyer Super-Six for Exakta.....	£11 17 6
F/5.6 Dallon Telephoto for Exakta.....	£6 0 0

## **NATURAL COLOUR PHOTOGRAPHY**

**N**ATURAL colour photography is now available to all photographers without the use of special apparatus and at very little extra cost. Dufaycolor Roll Films and Film Packs are as simple to use as ordinary films, yet without the use of special filters they produce transparencies in beautiful natural colours. On sale at all approved Ilford dealers.

**N**ATURAL colour photography is also available for the amateur cinematographer for 16 mm. cameras. Dufaycolor cine film is sold in 50 feet and 100 feet daylight loading spools. No additional attachments are required, but a plain single-colour daylight compensating filter is supplied free with each carton of film.

# Riverside Sunsets

By H. D. KEILOR.

**D**URING most months of the year there are many good opportunities for practising sunset photography. Unsettled and stormy weather conditions will frequently result in fine sky effects towards evening, and many photographers will be tempted to bring out their camera on such occasions.

Sunsets are always easiest to photograph when they occur over a stretch of water. Few places therefore are better suited to the photographer's purpose than the banks of a winding river, where many different viewpoints can usually be found within a mile or so. It will frequently be found that a bridge faces the right direction; this is generally a good spot for making exposures, as the high viewpoint enables a large expanse of water to be included. A good viewpoint should be carefully chosen beforehand, and then no time need be wasted when a good sunset occurs. As the season advances the position of the setting sun will change considerably, and this will give a further range of viewpoints.

The main point to remember when photographing a sunset is that the sky alone will hardly ever be sufficient to make a complete picture. The foreground must always be chosen with great care, and often it is an

advantage to make this fairly bold and strong; it should of course be arranged as far as possible to compose with the sky. Mist and smoke can often be advantageously employed to enhance the pictorial effect, and for this reason the riverside in large towns will often provide sunsets of a most dramatic kind.

This is essentially a subject for a panchromatic plate or film, and a light colour filter should be used if there is much colour in the sky. Exposure should be kept on the short side for the sake of the sky, but it must always be sufficient to avoid serious under-exposure in the foreground. Very dark foregrounds should therefore be avoided.

When printing sunset pictures it will often be found necessary to give the sky

slight extra exposure while shading the darker parts of the foreground. This has to be done with great care, but it is surprising what an improved result it will give in many cases. The range of contrast between sky and foreground is often greater than the average plate or film can render.

By BERNARD

*A Protest.*

TO view any collection of animals from the portrait point of view provides the amateur photographer with a wealth of subject matter both humorous and pictorial. Totally unconscious and only too ready to offer the expression that will react to the slightest feeling of pleasure, annoyance, or boredom, most animal or bird heads open a wide field of activity to the camera.

There is the imposing strength of the lion,

the amusing expression of the camel, and it needs very little patience to find almost any human expression on the face of a monkey or ape. It is an ideal subject for the amateur cinematographer, and a golden chance for the miniature camera.

The most rapid plates or films, preferably the double-coated panchromatic variety, such as the super-sensitive pan. film, or hyper-sensitive pan. plates are amongst the most suitable types to employ, and although the lighting conditions can often be

*Salaam.*

*Forty Winks.*

considered almost in the same way as for human portraiture in sunshine, the rapidity with which most animals change their expression and pose necessitates the fastest possible exposure. Also if the subject is taken close to the camera it must be remembered that there will be a corresponding lack in the depth of focus, and unless the photographer is very quick in setting the camera, it is wise to take advantage of the smallest lens stop that the available light and rapid exposure will allow.

Often it is better to take the subject fairly small on the negative, relying on

# TIME at the ZOO

ALFIERI, Jun.

considerable enlargement, than to try to fill the plate; and on many cameras this will be a necessity; but in view of the excellent enlargements that can be obtained from small portions of the plate or film where this has been developed for fine grain, it need not prove any hardship.

Most cameras are suitable for this type of work, but those of the reflex class widen the field of operation, as they allow the photographer to approach nearer to the subject, and it is much easier to plan a rapid composition by seeing

*Beware!*

pressure that will release the shutter on the first sign of obtaining the desired effect.

It need hardly be said that such subjects as these, if well done, are extremely popular with the great majority of people, old and young. No one realises this fact more fully than the lecturer who can include slides of animal portraits. They practically always score heavily.

*The Introduction.*

the actual image rather than hunting for it quickly in a small view-finder. The ease with which most miniature cameras can be set, combined with the advantages of a short-focus lens, tend to place them foremost in the field.

Where a reflex camera is employed, the easiest method of dealing with an animal head is to focus it rapidly in the correct position on the screen, and then, raising the mirror nearly to the top position, the photographer can watch the actual expression of the sitter and give the final

*The Guardian.*

# "The A.P." Monthly Competitions

## AWARDS FOR JULY.

AS is usual at this time of the year the entries in our three monthly competitions were very numerous, and included much first-class work. The Intermediate class was perhaps not above the average, but in the Advanced section there were many prints up to the best exhibition standard. Among the Beginners' entries were a considerable number which promised great things for the future. As usual in this class many prints were disqualified for exceeding the size limit.

The awards are as follows:

### ADVANCED WORKERS' SECTION.

First Prize.—"Storm Clouds," by C. A. White, 3, Medina Avenue, Newport, Isle of Wight.  
Second Prize.—"Behind the Lattice," by Yabya Arif, 5, Rue Laurens, Station Sarwat Pacha, Ramleh, Alexandria, Egypt.  
Third Prize.—"Moored," by C. Peters, 46, Fore Street, Redruth, Cornwall.  
(Mounting prize withheld).  
Certificates of Merit.—"Two Men in a Boat," by Geo. A. Slight, 18, Ewelme Road, Forest Hill, S.E.23;

"R. D. Screwvala, Esq.," by H. K. Dadyburjor, Panday House, Malabar Hill, Bombay, India;  
"Hands," by Miss V. M. Emms, Winton, 5, Cedars Road, Hampton Wick, Kingston-on-Thames; "The Open Air Girl," by C. D. Notley, 34, York Mansions, S.W.11.

The prints not receiving awards have been grouped, those in the first group receiving Honourable Mention. The others have been marked Class 1, Class 2 and Class 3 respectively.

Those awarded Honourable Mention are as follows: W. Jackson (Hull); Horace V. Massie (London, W.3); Dr. I. Magdi (London, N.W.9); Edward Alenius (New York); A. V. Bibbings (Newton Abbot); J. H. Clark (London, S.E.5); H. Emmett (Northwich); C. D. Notley (London, S.W.11).

### INTERMEDIATE SECTION.

First Prize.—"The Call to Prayer," by A. Acott, The Mill House, Roxwell, Essex.  
Second Prize.—"Prelude to the Storm," by C. T. Mills, 16, rue Verte, Rouen, France.

Certificates of Merit.—"Portrait of a Sand-dune," by H. A. Kharas, 43, B. J. Road, Bandra, Bombay, 20, India; "Cherry Blossom," by Mrs. K. M. Parsons, 83, Saint Peter's Avenue, Caversham Heights, Reading; "Salve Dimora," by E. Barwell, Gayling, Camberley, Surrey; "Scotney Castle," by Miss E. M. Sheppard, 2, Blundell Road, Luton, Beds.

### BEGINNERS' SECTION.

First Prize.—"Night Watchman," by Andrew P. Linton, 6, Grampian Gardens, Hendon Way, N.W.2.  
Second Prize.—"Thirst," by P. K. Shah, No. 275, 12th Road, Khar, Bombay, 21, India.

Certificates of Merit.—"Learning to Swim," by J. B. Hughes, 21, Castle Street, Conway, North Wales; "Eventide," by William Maddock, 145, Gladstone Street, Winsford, Cheshire; "Little Church, Guernsey," by A. J. Fensom, 8, Capron Road, Leagrave, Luton; "Taking the Bend," by D. M. Thorley, 24, Valley Road, Kenley, Surrey; "Overlooking Lake Derwentwater," by E. H. Hardy, 5, Warren Terrace, Wakefield, Yorks.

# "The A.P." Monthly Competitions

## PRIZES AND RULES.

To encourage pictorial outlook and good technique in the photographic work of our readers in all parts of the world.

### (I) For Advanced Workers.

This class is open to all amateur photographers.  
First Prize.—One guinea in cash or "A.P." silver plaque (optional).

Second Prize.—Half a guinea in cash or "A.P." bronze plaque (optional).

Third Prize.—Five shillings in cash.  
A special prize of five shillings in cash for the best mounted picture.

CERTIFICATES OF MERIT.  
In addition to the general rules (see below), the following conditions apply:—

- (1) All prints must be accompanied by a stamped addressed envelope or wrapper if they are to be returned. Prints receiving an award will be retained.
- (2) Prints must be mounted, but not framed.
- (3) Returnable prints in the Advanced Section will be sent back with a typed criticism, and classified according to merit.
- (4) Prints may be of any size and by any process, and must be the competitor's own work throughout.
- (5) The award of a prize or certificate in the Advanced Workers' Competition or any other competition or exhibition will not debar the competitor from entering again on future occasions and winning further prizes.

### (II) For Intermediate Workers.

This class is to encourage those readers who have passed the "beginner" stage and may have won an award in the Beginners' Competition, but have not progressed sufficiently to enter in the Advanced Competition.

First Prize.—Half a guinea in cash.  
Second Prize.—Five shillings in cash.

CERTIFICATES OF MERIT.  
In addition to the general rules (see below), the following conditions apply:—

- (1) No print must be larger than 10x8 in., and can be by contact or enlargement by any process, and may be mounted.
- (2) The whole of the work (exposure, development, printing, etc.) must be carried out by the competitor.
- (3) Prints entered in the Intermediate Section will be criticised and returned if accompanied by stamped addressed envelope or wrapper. Prints receiving an award will be retained.
- (4) The award of a prize or certificate in the Intermediate Competition debars the competitor from entering this competition again, but he is then eligible for the Advanced Workers' Section.

### (III) For Beginners.

This class is open to those who have never won an award in any photographic competition or exhibition.

First Prize.—Half a guinea in cash.  
Second Prize.—Five shillings in cash.

CERTIFICATES OF MERIT.  
In addition to the general rules (see below), the following conditions apply:—

- (1) No print must be larger than 6x4 in. Contact prints or small enlargements up to this size are eligible, but must be unmounted.
- (2) The exposure must have been made by the competitor, but developing and printing may be the work of others.
- (3) No prints can be criticised or returned.
- (4) The award of a prize or certificate in the Beginners' Competition debars the competitor from entering this section again.

### General Rules.

- (1) Any number of prints may be entered, but each print must have on the back the appropriate coupon

(see advertisement pages) the date of which must be within five weeks of the closing date of the competition. Overseas readers may use the most recent coupons to hand.

(2) Each print must have on the back the name and address of the competitor, and the title.

(3) All entries must be addressed to The Editor, *The Amateur Photographer*, Dorset House, Stamford Street, London, S.E.1, and the package must be marked on the outside "Beginners," "Intermediate," or "Advanced," as the case may be.

(4) No packages will be received on which there are postage charges to be paid.

(5) No communications on other matters should be enclosed with competition prints. No correspondence in connection with the competitions can be undertaken.

(6) The entry of a print will be regarded as a declaration that it is eligible under the rules, and that the competitor agrees thereto.

(7) No responsibility is taken for the safety of prints, and the Editor's decision on all points connected with the competitions is final.

(8) The publishers of *The Amateur Photographer* shall have the right to reproduce, without payment, any print entered, or to allow its reproduction in any other paper quoting from *The Amateur Photographer*.

(9) The closing date of each competition is the last weekday of the month. Prints arriving late will be entered for the next month's competition.

(10) The cash prizes awarded in these competitions are dispatched on the fifth-ent of the month following the announcement of the awards.

The closing date for the August competition is Saturday, August 31st, and for the September competition, Monday, September 30th.

# Exhibitions and Competitions

## CURRENT AND FUTURE.

Notices of forthcoming exhibitions and competitions will be included here every week if particulars are sent by the responsible organisers.

*The Amateur Photographer* Monthly Competitions for Beginners, Intermediate and Advanced Workers. Entries, August 31. Rules in this issue.

California Pacific International Exhibition, San Diego.—May 20–November 11. Particulars from Miss Ruth Kilbourne, Exhibition Headquarters, Balboa Park, San Diego, Cal., U.S.A.

Paris International Salon.—October 5–20. Secretary, M. E. Cousin, 51, Rue de Clichy, Paris.

Southern Counties Salon (organised by Camberwell C.C.).—August 11–31. Hon. Salon Secretary, W. Bertram, 45, St. Lawrence Road, Brixton, S.W.

Amsterdam International Salon.—September 14–29. Further particulars from Focus, Ltd., Fotosalon, Bloemendaal, Holland.

London Salon of Photography.—Entries, September 4; open, September 14–October 12. Further particulars from Secretary, London Salon, 5a, Pall Mall East, S.W.1.

R.P.S. Annual Exhibition.—September 14–October

12. Further particulars from Secretary, 35, Russell Square, W.C.1.

Irish Salon (to be held at Mansion House, Dublin).—Entries, September 14; open, November 2–9. Particulars from Hon. Secretary, Irish Salon of Photography, 18, Morehampton Road, Dublin.

Rotherham P.S. International Exhibition.—Entry forms due, September 23; prints, September 30; open, October 16–19. Hon. Exhibition Secretary, E. George Alderman, Ruardean, Newton Street, Rotherham, Yorks.

Indian International Salon (promoted by Camera Pictorialists of Bombay).—Entries, October 1; open, November 17–30. Hon. Salon Secretary, F. R. Ratnagar, Central Bank Building, Fort, Bombay, India.

G.W. Rly. "Camp Coach" Holiday Competition.—Prize, one week's holiday in camp coach during 1936 holiday season. Photographs should depict any aspect of camp coach holiday. Entries due, October 31. Further particulars from Superintendent of the Line, G.W.R., Paddington Station, W.2.

Canadian International Salon, National Gallery of Canada, Ottawa.—November 6–21, and afterwards in other Canadian cities. Entries due, September 20. Entry forms and further particulars from Exhibition Secretary, Canadian International Salon, National Gallery of Canada, Ottawa, Canada.

Cape of Good Hope International Salon (under the auspices of Cape Town P.S.).—Entries due, November 19; open, January, 1936. Hon. Salon Secretary, Richard Dekenah, P.O. Box 2431, Cape Town, South Africa.

Leicester P.S. International Exhibition.—Entries, January 24, 1936; open, February 24–March 7, 1936. Exhibition Secretary, H. Foscutt, 19, Doncaster Road, Leicester.

The 40th Annual Exhibition of the South London P.S.—Open, February 15–March 14, 1936. Entries close, January 21. Further details and entry forms from Hon. Exhibition Secretary, H. S. Adams, 40, Stockwell Park Road, London, S.W.9.

# Candid Portraiture with a Miniature Camera

By JOHN K. CHALMERS.

PERHAPS the perfect camera has not yet been found, but the miniature camera possesses decided advantages, one of which is the

Fig. 1.

possibility of obtaining candid portraits, and the other, closely allied to it, is that its presence does not produce

Fig. 2.

a sense of camera-consciousness. I have found that my little outfit produces a sense of incredulity, and with children a feeling of interest.

Portraiture is a difficult branch of our art, and perhaps it has been made more so by the over-retouched specimens turned out by so many professional workers. We are forced to the conclusion that the sitters must surely desire anything other than reality. Perhaps for this reason it is best for the amateur to refrain from photographing young ladies until he has had considerable experience, but a plan I adopt is first of all to show the result to the young lady's friends, and they usually admit its truthfulness. Armed with this information it is an easy matter to hand over the portrait, mentioning quite casually what her friends have said. The plan works.

But the miniature camera does score when photographing elderly people. For instance, the old folks in Figs. 1 and 2 had never been photographed before, and certainly would not have consented to sit for me had they not been intrigued by the funny little thing held to my eye, and taking a picture not much larger than a postage stamp. Their delight when they saw a 12×10 enlargement was a treat to behold. Fig. 3 is a typical study of a gentleman who was so pleased with the result that he ordered a large supply and thus paid for the outing. Fig. 4 was taken to give a dramatic effect, and the lighting will perhaps show young amateurs the possibilities of outdoor portraiture.

The trouble with the negatives from these small outfits is, so I read, the presence of *grain*. Personally I find no difficulty in enlarging to 12×10 without any sign of grain, and the developer used is my old standby—Rytol. I invariably develop for two-thirds of the suggested times and keep all solutions at 60° to 65°. I find this most essential. Perutz Rectepan (without filter) gives me all I want, but I am sure any other film handled carefully will be equally satisfactory.

Of course, retouching is not possible on these miniature nega-

Fig. 3.

tives, nor any work on them, but a little judicious shading during enlarging is sometimes helpful. Finally, use a meter, and slightly over-expose, and do not over-develop.

Candid portraiture is an engrossing study, and in my experience is much more lucrative than other free-lance work, and this is a consideration with many amateur workers.

Fig. 4.

# ARCHITECTURAL LIGHTING

By  
E. GORDON BARBER.

1. Lincoln—Morning.

WHILE it is fairly common knowledge that there may be a *best* time of the day for photographing any particular subject, it is not so commonly realised how many different and interesting variations occur from sunrise to sunset. This applies to all photographic subjects, but particularly to architectural work.

3. Windows—Morning.

For outside architectural work, the presence of bright sunshine is practically imperative if anything interesting is to be obtained, and it is usually preferable to make use of the morning and evening only. There are buildings with deep recesses, such as the buttressed naves or choirs of Gothic cathedrals, where deep shadows exist practically throughout the day, but these are the exception rather than the rule.

With modern buildings especially, the flat façades now so prevalent demand a very critical angle of lighting if all their details are to be emphasised.

One comforting thought about architectural photography is the possibility of photographing interiors without bright sunlight. This is one of the very few subjects which do not need the sun, as the contrasts are usually so great that any amount of strong sunshine may make the subject impossible.

In the case of cathedrals and churches, the most promising time of day for a certain effect can usually be predicted. The mediæval plan for a cathedral was for the sun to rise behind the east window on the appropriate saints day, and although this is by no means general, all churches have, of course, their length in a west to east direction.

The west front of cathedrals is frequently the most imposing viewpoint externally, even in this country, where, however, the elaborate (if sometimes over-decorated) effect of so many continental churches is lacking. In this case, then, a *contre-jour* lighting is inevitable in the early morning, and a flat frontal lighting in the evening. The most attractive effect, especially when a deeply recessed front is found, is often later in the morning when the rays of the sun are just glancing across. The two extreme effects are illustrated herewith by Lincoln Minster, No. 1 having been taken at about half-past eight in the morning and No. 2 at six in the evening on the same day.

In the morning picture the *contre-jour* effect is so emphasised that practically all architectural detail is lost, the building being little more than a silhouette, while in the evening a very good idea of the sculptured front can be obtained, in spite of the very flat lighting. The geography of ecclesiastical buildings being so definite makes it a fairly easy matter to decide what time of day to use for photographing different parts.

In the case of other buildings it is not possible to predict beforehand the lighting at different times of the day as in the case of churches, since, of course, this depends on the direction the building faces, but the same principles of lighting apply and a great variety of effects may be possible. The last two

2. Lincoln—Evening.

illustrations are from Cowdray Castle, in Sussex, which is reputed to have the finest Elizabethan windows in the country. The morning sunlight in this case passes through the ruined building, casting an intricate pattern on the green turf below, but in the evening the light coming from the front almost disguises the ruinous condition, and it is difficult to believe that the windows are no longer even glazed. These two pictures, like those illustrating Lincoln Minster, were taken on one day, which only goes to prove that the variety of photographic opportunities in a single day is as great in one season as another.

4. Windows—Evening.

# How I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CCXCVI.

Mr. ALFRED  
SAUNDERS.

From information communicated to our Special Representative.

"BEFORE sending any print to an exhibition I ask myself 'Is it worth sending?' I do not send a print unless I think it has a fair chance of success, for besides wasting the judges' time, it only reflects adversely on the sender. In this way I keep up the standard of my work.

"I am not in favour of 'stunt' photography, and if 'stunting' is to be interpreted as originality then I prefer to be regarded as old-fashioned. Few people would climb a ladder to see what it looks like from above, but that is the sort of thing which has been 'charging' its way into our exhibitions of late, and looks about as peaceful there as a 'bull in a china shop.'

"Much of my photography is of birds and animals, and before attempting any exposures I endeavour to learn something of the life and habits of the bird or animal I wish to photograph. In this way I am able to illustrate any particular habit and so make my pictures tell a story.

"Having studied my subject I try

to get a viewpoint showing the best composition. I then study the lighting and if it is unsatisfactory (and I am not pressed for time) I wait until the sun is at the most suitable angle, and so obtain a picture as well as a record. I like the sun to strike obliquely upon my subject or come from behind it. A good lens hood makes this possible and prevents fogging.

"Whilst setting up my camera and making preparations generally, I study my subject and try to remove any traces of nervousness or fear it may exhibit by working quietly and unobtrusively, and, whenever possible, slowly and deliberately.

"I use a fast panchromatic backed plate in conjunction with an Ilford 'Alpha' filter, and seldom find changes from this rule necessary. I give ample exposure, and develop with half-strength pyro-soda, using a modified time and temperature method. I do this in complete darkness. By these methods I am able to produce a negative full of detail with neither the high-lights

'clogged' nor the shadows 'empty,' and giving good gradation.

"As official photographer on the R.R.S. 'Discovery II' Royal Research Ship my negatives are usually developed and washed under difficulties. Besides having to contend with a heavily rolling ship, a shortage of fresh water adds to my difficulties. To overcome the latter I wash my negatives in sea-water, giving them a final bath of fresh water to remove the salt. The sea-water does not damage them in any way, and I treat my prints in a similar manner.

"Making enlargements from these negatives is usually straight-forward work—a little shading being often all that is necessary. I use a bromide paper which I think best suits my subject and make test strips for each negative. This is rather laborious, but saves time and paper in the long run.

"I usually dry-mount my prints, and then rule a neat pencil border round the edges. I think that this not only adds a note of neatness to the print, but gives it an extra touch of finish.

"My landscapes are usually scenes of ice and snow, and I am able to retain the texture and brilliance of the latter by using the same method of exposing fully and developing lightly as I do for natural history subjects. I prefer faithful reproductions to pictorial 'licence' and the only indulgence I allow myself is the addition of clouds when none exist in the original.

"I regard the proper rendering of tone values as of the greatest importance. Ice, snow and sky form wonderful combinations, and to do justice to their beauty and grandeur demands the most careful attention to the technical side of the work. In a way it may be said that the pictorial aspect will more or less look after itself. That is already there; the thing is to secure it.

"I use either a reflex or a field camera, but think that where the determination exists, results of the quality to satisfy the most critical of judges can be obtained with almost any type of camera."

(A further example of Mr. Saunders' work is reproduced on one of the centre Art pages.)

GROTVIKEN, S. GEORGIA.

A. Saunders.

# Pictorial Analysis

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"THE BEACHCOMBER," by John Henderson.

IN dealing with portraiture where large heads alone are concerned, it is but seldom that, beyond seeing that the head is well placed in the picture space, there is much in the nature of constructional composition.

So long as there is a reasonable amount of margin all round and the head is not placed in an eccentric relationship with the pictorial margins, almost any placing can be made acceptable. It is, however, necessary that the eyes—or eye in the case of a profile—should be strongly placed or well within the picture, and that, where the full face is not shown, there should be more space on the side to which the gaze of the sitter is directed.

In this particular instance, the head is seen in profile and the two essential conditions, enumerated above, are satisfied. The only eye that is visible is placed upon what is considered to be one of the strongest positions of a picture, i.e., one of the points formed by intersections of divisions of thirds, and, the model looking to the right, there is more space on that side than on the other. For all practical purposes, that is all the composition amounts to, and it would not greatly matter, as long as the present proportions were retained, whether the surroundings were extended to quite a considerable degree or restricted just a shade more. Restriction could not, of course, be carried very much further, or, by drawing attention to itself, its aim would be defeated. It is valuable in creating an impression of concentration, but, if it goes too far, it occasions a dispersal of interest rather than a concentration, for it involves the removal, as a rule, of an essential element.

Here, the truncation of the top of the cap does not invite any sense of undue restriction, simply because it is not carried to such a point that it becomes noticeable. If, however, the upper margin were brought much lower, the suggestion of restraint would

make itself felt, either for the reason that the position of the eye would be displaced, or, if the remainder were trimmed to correspond, by a more general impression of constriction, to say nothing about that of lack of a sufficiency of margin.

On the other hand, the setting could be extended appreciably without ad-

The proportions finally decided upon depend, to a large extent, upon individual taste. There can be no definite ruling upon a question such as this, and if the author, in this instance, feels that he has adopted a spacing that suits the sitter best, he is entitled to his opinion. The existing arrangement, no doubt, will be acceptable to the majority.

In a case like this, however, it is questionable if the pronounced diffusion with which the image is rendered is at all advisable.

The suggestion of character is, perhaps, the most important feature of a portrait. An impression of character is drawn partly from the expression; partly from the set and nature of the features; but, in the main, from the lines which age and life implant.

The more clearly and realistically these lines are defined the greater is the impression of character, and, by just as much as they are diffused, by so much the rendering falls short of the ideal. Beyond this, there is a lack of decisiveness that is attributable to the same cause, and, taking it all round, it does seem a pity that such a degree of diffusion was introduced.

There may be some excuse for its adoption when, to meet the wishes of a younger sitter, it is desired to hide the lines of advancing age, but, even in a case like this, it is scarcely justified from the pictorial or realistic point of

view, and, when age is the subject and the excuse is no longer applicable, its employment is nothing but a drawback.

Disregarding this particular aspect, however, the work has much to commend it. In lighting and arrangement, it is very pleasing, there is a suggestion of the beauty and character of age, and the pose is natural and spontaneous. It shows a considerable degree of promise for the future, and further work from the same source will be awaited with interest.

"MENTOR."

verse effect, assuming, as already has been mentioned, that the relative position of the head remains the same; but, in order to secure the necessary degree of concentration, it might be found advisable to arrange for the portions of the background near the edges to be deepened in tone, particularly if the extension involved the inclusion of much more setting than at present. By this means, the head would be shown against a portion of the background lighter than the rest, the shading off tending to direct the attention inwards.

# PICTURES by Novices

*SOME CRITICAL COMMENTS on  
the Beginners' prints reproduced on the opposite page*

THE sky in No. 1 of the prints reproduced on the opposite page—"Cumberland," by D. F. Greig—has a fine cloud effect, and, as far as distance and middle distance are concerned, makes up very happily indeed, but the foreground, which makes such a feature of a stone wall, might, conceivably, be better chosen.

## **Foregrounds in Landscapes.**

A landscape should be homogeneous and all its parts in harmony with one another. It is true that these stone walls occur all over the district in question, and that it is most difficult either to avoid them or to include them in the scene in such a way that they do not become an eyesore, so that, if at all possible, their adoption as an element in the foreground should be guarded against.

Occasionally, they can be incorporated without ill effect, but, as a general rule, they prove most unamenable, and, just as it happens in this case, they seem to form a sort of barrier between foreground and middle distance.

These two parts of a landscape should always have a visible connection, and, had the wall displayed a gap somewhere about the middle such a connection would be established. In such circumstances the inclusion would be tolerable, if not as pleasing as if it did not make an appearance, but it is often possible, by dodging about with the viewpoint, either to get rid of it altogether or to reduce it to insignificance.

It may be that the expedient would have had the desired result in this instance, and, if so, it might well be tried should the opportunity offer itself, although, unfortunately, the chances of the otherwise attractive features recurring are remote.

## **Inadvertent Inclusions.**

In the case of No. 2, "Demolition," by R. J. Marshall, the type of subject is very different, but the figures in the foreground, similarly, convey the impression of an inadvertent inclusion.

They do, as it happens, fill a space that might otherwise seem somewhat vacant, but, all the same, they are now on too large a scale and not sufficiently well placed to do the job

effectively. Were they closer to the operations in progress, more "in" the picture, and smaller in scale, the arrangement would be better, though, to sustain the title, it would be preferable had the subject been taken before the pulling down had reached the present stage—i.e., when more of the building was visible.

On the other hand, No. 5, "The Quay, St. Ives," by Harry Dunks, goes to the opposite extreme and displays a foreground conspicuous for its emptiness.

The inclusion of a suitable figure or group of figures, particularly if they could be so caught that they were shown in full sunlight against the shadow, would make all the difference in the world, and the present feeling of blankness would be avoided.

## **Point and Emphasis.**

Moreover, they would lend point and emphasis to a subject that, despite its good workmanship, only suggests the qualifications required for a setting, or, at most, a topographical interest.

No. 3, "Hesitation," by N. S. Mehta, which does include a group of figures, is both good and bad. It is good, inasmuch as the principal figure—the one engaged in contemplation of the flowers on the stall—is very well caught indeed, but bad because all the other figures serve no purpose in the scheme and are only needless inclusions. The nearest, of which a back view is shown, is an obvious inadvertence, and so is the one on the extreme left. The farthestmost male figure might be retained to set off the girl, but even he is not essential, and if the subject could be imagined without all these extraneous elements, it will be realised how much greater its attraction would be.

All the interest would be centred in the girl, and, instead of the attention being dispersed over a number of attractions, it would be confined to one. The picture would acquire unity, and would rank as quite a good genre study.

However, chance plays a very considerable part in securing figure studies of this type, but patience, aided by experience, does, in time, enable a proportion of successful efforts to be obtained.

## **Figures as Features.**

The figures in No. 4, "Sunday Afternoon," by R. Norman Rook, are very small in scale and by no means as significant. Nevertheless, they are more fortunately disposed, and lend a touch of life to a scene that is otherwise inclined to quiescence.

As a matter of fact, the group on each of the two boats nearer to hand might be made the chief centres of interest of two separate pictures, the first including that portion of the right-hand side up to, but just missing, the figures on the second boat, and the other embracing that part of the print from the right-hand margin to a line coincident with the shadow on the hull of the second vessel.

Both sections would need a degree of enlargement to make them effective, but the definition seems pretty critical and no special difficulty need be anticipated.

In No. 6, "After the Show," by Gordon Rich, there is a recurrence of a superfluity of figures. Besides a long row of horses, there are a number of human figures, and, with so crowded a subject, it is well-nigh impossible to isolate just enough to make a picture.

## **Practical Realism.**

The representation may be the essence of realism, but, while it also may be as good as could be obtained in the circumstances, it does not form a practical subject.

Realism, to be effective, must be practical, and it is not practical to attempt to include so many items of interest in a single theme. The same argument is applicable, again, in the case of No. 7, "After Dark," by J. R. Cox, where the number of lights creates a similar feeling of confusion. Here, the suggestion is exaggerated by the excessive depth of tone in which portions of the print are rendered, on account of which the subject material itself is obscured.

The cause arises from over-development of the negative, accompanied, in all probability, by under-exposure. The former may be corrected by the substitution of a softer type of paper, but the effects of the latter are irremediable.

"MENTOR."

# With the Beginners

NOTES AND NOTIONS FOR THE  
LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

## CAMERA LIMITATIONS.

I WANT to make a quotation or two from a letter sent to the editor by one or two readers in Ireland. Here is the opening one: "How often have we envied those whose camera enables them to make such glorious pictures as those found in 'The A.P.'"

This is a very old fallacy—the idea that you can make good pictures only with an expensive camera; or, put in another (and still more erroneous) way, you have only to get a top-hole camera and it will inevitably make top-hole pictures for you.

Leaving this for the time, I quote further: "Unfortunately, we belong to that great army of 'ordinary' camera users, i.e., those whom circumstances debar from possessing anything more imposing than (as in our case) a pocket Kodak with only two speeds,  $1/25$ th and  $1/50$ th, T. and B., and the usual 1, 2, 3, 4 stop system."

Fig. 1.

Fig. 2.

And I should like to know what is wrong with such an outfit. I had been at photography a good while before I acquired a camera anything like as efficient. Last year, one of the outstanding pictures in a fine position in the London Salon was taken with just such a camera as our friends describe. And it was not the only "glorious picture" made from a "simple camera" negative.

This also I leave for the present, and again quote: "There are a great many people besides ourselves who, confined as we are to such material, would like to make

Fig. 3.

the most of same. We would value greatly an article in 'The A.P.' dealing with this, thus enabling us to venture a little farther than the 'group snapshots,' and helping us to pursue our hobby until such times as we may be in a position to procure a more expensive instrument."

There it is again—crawl along till the more expensive instrument arrives, and then gallop. Stuff Anyone who cannot make pictures with a pocket Kodak, or its like, will not make them with the most expensive and elaborate outfit obtainable.

When our friends say, however, that they would like to make the most of what they have, I am heartily with them. That is the sensible thing to do. It is what this paper has been trying to teach as long as I have known it, and what I myself have been driving at ever since I started writing photographic articles.

As soon as I can, I will try to sum up the limitations which are certainly imposed by simple apparatus, and how some of them can be more or less modified or even overcome. But you may be sure that you will not find me admitting that even the most fearsome limitations prevent the making of pictures. I maintain seriously that fine photographic pictures can result from the use of a camera that could be made at home for—nothing!

Although our Irish friends may not have noticed it, I have just been talking for a week or two about the use of a simple camera, and showed, amongst other things, that I made some exposures at the Zoo all at  $f/8$  and  $1/25$ th of a second. The fact that I did not get a "glorious" picture was not due to these limitations.

Fig. 1 is from a whole-plate enlargement I said could be made from a little bit of one of the  $3\frac{1}{4} \times 2\frac{1}{4}$  negatives. In

Fig. 4.

Fig. 2 I have picked out, also on a whole-plate, the two elephants which in the original were rather lost in their surroundings.

On the same lines I have picked out from the negative of Fig. 3 the part shown in Fig. 4, and it is very obvious that I could have made this into two separate subjects.

Of these things, also, more anon. The Irish question has diverted me—in the sense that it has run me off the intended track.

W. L. F. W.

## THROUGH THE PORTHOLE By ERIC WAKEHAM.

**A** ROUGH sea—just rough enough to make some form of occupation a necessity if surrender was to be avoided; too rough to make any of the normal distractions of the magnificent liner I was on appeal to flesh rapidly dominating the spirit.

I went to my cabin. It is often less tiresome lying down. But I did not, after all, lie down at all that afternoon. On the cabin table was an object which distracted, without my consciously realising it, all my attention from bodily discomfort.

It was an object I had bought only a few days before at Port Said. I picked it up; fiddled with the lens aperture setting; the shutter timing; focussed various objects in my floating

room through the reflex finder. Like all photographers I was aching to use my new toy.

And then came the inspiration. A wave, larger, fiercer than its fellows, hurled itself against my closed porthole. I jumped on to my bunk, snapped the receding wave at whatever settings my fiddling had left on the camera. They happened to be  $f/5.6$  and  $1/100$ th, focus infinity. The result of this fluke shot is shown in figure 1.

Opportunism gave place to pre-meditated photography. Seascapes were difficult subjects. I would experiment. I opened the porthole, was promptly covered with spray and nearly blown off the bunk by half a

gale. However, two minutes gave me the chance to snap a wave or two through the partially opened porthole. The results are shown in Figures 2 and 3;  $f/8$  and a  $1/200$ th were used for these shots.

I then composed my ruffled hair and thoughts. The porthole was wiped with a towel and screwed shut once more. The camera lens was wiped free of spray. The camera was set at  $f/4.5$  and  $1/300$ th and I took up my position waiting for a suitable wave to give me that exhibition picture I had dreamed about in early life. The result is shown in Figure 4, taken through one inch plate glass. I then went up and made a hearty tea.

# Picture Points

## for Beginners, by RICARDO

### Aerial Perspective

IT seems to be the ideal of every beginner to show as much detail as possible in every negative, quite regardless of the type of subject matter. Landscape pictures in particular seem to suffer most in this respect.

Technically speaking, it is very satisfying to see such needle-sharp definition in every plane of the landscape, but for a pictorial rendering, such all-over sharpness is not necessary.

To mention only one reason which we shall discuss here, is, that by penetrating the atmosphere to reveal distant details as clearly as those nearby, destroys the effect of distance.

These two sketches of the same subject matter, in which the tone values have been purposely contrasted, make this point clear, and show when a filter is not desirable.

The explanation is that strong contrasts in tone always attract the attention most and, as shown in the first sketch, this causes the eye to be drawn immediately into the horizon—and stay there. In the second sketch, however, the eye is allowed to wan-

der from the foreground along the valley, into the distance, easily and naturally, and so be allowed to appreciate the landscape. This is an occasion where one is justified in darkening the foreground to improve the pictorial effect.

### Relevancy in Subject Matter

AMONG the many points to be considered when arranging or selecting the subject matter, is the most elementary one, that each item shall be, within reason, suitably related to each other. This can best be explained by referring to the two sketches. On the left, the still-life picture is composed of a bowl of roses, a loaf of bread, and a pipe and ashtray, three wholly unrelated articles. While each group could be the subject of an attractive picture, it is quite absurd to place all three together. One does not usually associate such entirely different objects, therefore it is equally unsuitable to portray them together. This is granted to be an extreme case, but it serves its purpose well.

Another instance of irrelevancy is shown in the sketch on the right. This sort of thing is very popular with beginners, and although such pictures can be good technically and pictorially they have a personal, rather than a general appeal.

The inevitable reaction is of sympathy for the animal and a certain lack of appreciation of the photographer's sense of relationship and arrangement.

To score as a pictorial record of animal humour, the main essential is that the incident shall be quite spontaneous on the part of the animal, or, not obviously assisted. Perhaps that is why one sees so few outstanding examples of animal humour as compared with other branches of photography.

### Variety in Placing Tone Areas

WE have already, in this series, seen the danger of monotonous repetition when it occurs in lines and tones, and now we have a further variation in the

repetition of similar areas or shapes of tones.

In the top sketch, the distance from the bottom edge to the horizon has been purposely divided into three almost equal divisions and similarly, again from the horizon to the top by the placing of the two clouds.

Once it is noticed that areas of tone are equal in shape in any type of subject, it is very curious how they draw increasing attention to the fact every time the print is seen. The reason is psychological.

Every time an item is repeated, whether in line, tone, shape or area, the mental impression it makes gets stronger and stronger until it begins to dominate everything else in the picture. When this particular item does not happen to be the main point of interest, then the necessity of subduing it, instead of allowing it to stand out, is of great importance to prevent the interest from being divided.

An alternative arrangement of the same view is suggested in the second sketch. While it is not suggested it has now a strong composition, it serves to illustrate how we can get variety into areas, without having to adjust the tone values in order to relieve the monotony. It will be observed that the horizon is in the same position in each sketch.

# NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

**"Certos" Enlarger.** This new enlarger for 4×4 cm. and Leica-size films is of novel design. The lamp employed is of 15 watts which, by reflector design, is claimed to give an output equivalent to 60 watts. The purpose of using a lamp of low wattage is to decrease the heat of the lamphouse and so avoid buckling films. The lens has an aperture of f/4.5.

Although it appears in the illustration, which shows the "Certos" enlarger without its base-board, to be of horizontal pattern, it actually projects downwards by means of a silver surfaced mirror, which absorbs only .04 of the

light. If desired it can be used for horizontal projection by removal of the mirror. The films are held in ingeniously-designed carriers, which can easily be changed for the various sizes and preferably should not be cut from the spool. If already cut, carriers for single films are supplied. A very welcome fitment is the automatic exposure meter. This is worked in conjunction with a specially-designed diffuser, and determines the exposure needed by each negative, such meter also indicating the grade of paper (hard, normal, soft, etc.) necessary for the satisfactory enlargement of such negative. The whole is contained in a storage box 13½×11½×7½ inches and the price complete is £9 9s.

The sole importers are Actina, Ltd., 29, Red Lion Square, London, W.C.1, who will be pleased to send full particulars post free if *The Amateur Photographer* is mentioned.

A novel subject for a photographic competition is the illustration of anything in connection with the "Smoke Abatement" campaign. Prizes amounting to £20 in cash are offered, and particulars as to types of subjects, conditions of entry, etc., can be obtained from Mr. Arnold Marsh, National Smoke Abatement Society, 30, King Street, Manchester, 2.

We have received from The Westminster Photographic Exchange, 24, Charing Cross Road, London, W.C.2, the latest model of their "Victoria" camera. It is of the self-erecting type for sixteen exposures on 3½×2½ film. The case is of indestructible black bakelite, and the whole build is sturdy and well fitted. The lens is an f/2.9 Schneider "Radionar," in D.A. Compur shutter with speeds to 1/250th sec. Spools are easily loaded and removed, and the two peepholes have a safety shutter for panchromatic material. The price is £6 15s.

In a snapshot competition, arranged on behalf of Blackpool Victoria Hospital, amateur photographers have an opportunity of winning prizes of three guineas, two guineas and consolation awards, and of helping a worthy cause, as all the proceeds are to be devoted to the hospital funds. Photographs must be of scenes on Blackpool Pleasure

Beach and an entry fee of 6d. each is charged. Prints marked with the name and address of the sender, must be addressed to the Secretary, Victoria Hospital, Blackpool, with "Photo" written in the top left-hand corner of the envelope. The closing date is October 21st.

With some cameras, especially when used at eye-level, it is awkward to operate the trigger release of the shutter.

This difficulty is overcome by using the "Non-Flex" release, shown in the illustration, which can be instantly fitted by screwing it into the socket prepared for a flexible wire release. Pressure of a finger operates it at once. The price is 1s. 6d. This is one of many useful articles listed in a new accessories

catalogue obtainable from Messrs. Sands Hunter, 37, Bedford Street, W.C.2.

A Model III Leica, black finish, No. 149295, with 5-cm. Elmar f/3.5 lens, has been stolen from the premises of Messrs. M. W. Dunscombe, 5 and 7, St. Augustine's Parade, Bristol. Should this be offered to any reader he should at once communicate with the firm or the police.

We have drawn attention, as they appeared, to the volumes in the series, "Life and Art in Photograph," published at five shillings each by Messrs. Chatto and Windus. We found ourselves particularly interested in No. 6, "Wild Animals," with its round hundred of excellent examples of the photography of animals in their native haunts. While of strong general interest, the book will make a special appeal to all nature photographers, who will know how to appreciate the value and merit of the pictures reproduced.

## A Competition specially for Novices

### SUBJECTS.

Prizes will be awarded for the best snapshots of family groups or single figures taken at home or on holiday, indoors or outdoors. The arrangement of the groups or the pose of the figures is left entirely to the discretion of the competitor.

The competition is open only to novices: those who have never won an award of any description in a photographic competition.

Entries are restricted to contact prints. The smallness of the prints, which may be mounted if necessary, will not affect their careful consideration in this competition.

### PRIZES.

The prizes will consist of supplies of roll film or of plates (if any winner happens to use a plate camera).

THE FIRST PRIZE WILL BE TWO ROLL FILMS EVERY WEEK FOR ONE YEAR.

THE SECOND PRIZE WILL BE TWO ROLL FILMS EVERY WEEK FOR SIX MONTHS.

THE THIRD PRIZE WILL BE ONE ROLL FILM EVERY WEEK FOR SIX MONTHS.

TWELVE PRIZES OF ONE ROLL FILM EVERY WEEK FOR THREE MONTHS.

The winners of these prizes will thus be encouraged to continue their photographic activities throughout the year with a supply of free film.

### RULES.

Each print must have affixed firmly to the back, a coupon which will be found in our advertisement pages each week. This must contain title of print, and name and address of competitor.

The latest date for receiving entries is September 7th, 1935. This will give readers of "The Amateur Photographer" sufficient time to collect and to enter their best prints taken during the summer months.

The decision of the Editor in all matters relating to this competition must be accepted as final.

All entries must be addressed as follows: The Editor, "The Amateur Photographer," Dorset House, Stamford Street, London, S.E.1, and the outside of the envelope or package must be clearly marked "Novices' Competition."

# Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

## Themes for Feature Films By S. E. L. M.

Amateurs interested in the short feature film will find in their medium adequate scope for developing a sound, positive technique. But the success of the film itself depends upon the selection of suitable themes—a matter fully discussed in the following article.

"PHOTO-PLAYLETS" and even full-length film plays owe something of their continued existence to the fact that amateurs find a great deal of pleasure and amusement in the making of them. They do not, it is true, look very dignified beside the more serious and purposeful essays which advanced workers are turning out; but they nevertheless afford valuable training to many who will be in the advanced ranks of to-morrow.

Despite this fact, however, there is no reason why the pleasurable playfilm should not be made more satisfying, more workmanlike, than it is. Actually, if you study the recent work of the G.P.O. Film Unit, you will find that the change has already begun. Three or four very competent directors have taken hold of the short "feature" production, and they have produced something which is quite as dignified and as satisfying as some of the finest documentaries.

The secret of this transformation lies almost entirely in the *theme of the film*. Cavalcanti, Grierson and Stuart Legg have no use for the vacuous emptiness so characteristic of the familiar photoplay. Instead, they select for themselves a theme of definite purpose; and we see the results in "New Generation," "Pett and Pott," and other delightful little works.

### Finding the Theme.

Most of us at some time or other realise that the film is a distinctive means of expression—and as such it requires special treatment in the selection of its themes. Unfortunately, the orthodox procedure appears to consist of taking a newspaper story, novelette, poem or even a score of music and adapting the theme to the medium of cinematography. Not that the theme will definitely prove unsuitable (for reporters, writers, poets, musicians and sculptors can be inspired by a common theme); but almost invariably the *treatment* as well as the theme is adapted in the film transcription.

Now this is fatal to the film entity and has the effect of making the whole theme appear unsuitable for adaptation in cinematography. For epic poetry expresses through an heroic treatment, music through the medium of rhythms and a combination of tones, whilst the

popular thriller depends for its success upon a violent and an exaggerated form of treatment.

The film is different from all these. Its achievements depend upon the use of images, upon the cutting of those images and upon their correlation or final assembly. For this reason, no theme which cannot prevail without the assistance of laboured action and frequent captions is properly suitable for film adaptation.

### Individual Treatment.

Having selected the theme, it is necessary to bestow the treatment—and this provides the cinematographer with full scope for the exercise of his own ingenuity. The viewpoint of the short story or the moody atmosphere of the musical score must be entirely disregarded; instead, he must bear in mind the need for fluent, expressive images

and for establishing a dynamic relationship between the *force* of action and the *movement* of clever assembly.

If this procedure be adopted, there will be no mean plagiarism of short story or thriller themes—nor can there be any possible suggestion of an infringement of rights, for copyright is always in the *treatment* and never in the theme of any particular work or subject.

Apart from the assistance afforded by adaptations from other (fictional) forms of expression, a great deal of inspiration is to be found in the affairs and conditions of the surrounding world. Plans and material exist for a host of purposeful films, not forgetting a sensible safety-first and a real anti-war. Of course, something has been attempted with both of these.

But because the theme has never been properly selected, we feel we have yet to experience them in a manner which appears convincing.

The launching of a lifeboat is by no means a rare incident, and even if it be only for practice or test, and not for "business," it provides a fine subject for the ciné worker.

# Make, don't just Take a Film this Summer

By BRYAN MONTAGU.

YOU have bought, or if lucky have been given, a ciné camera. So far you have managed to take a film of your small cousin crawling on the lawn and your dog rushing over the flower-beds. Also perhaps some other members of the family who were not quite so easy to recognise. Now you have become more ambitious and strive for greater things.

Someone has told you to write a scenario around your summer holiday and make an amusing and interesting film of it. You are greatly excited by this idea and set to work straight away to write your scenario. But let me warn you. You will meet difficulties at every turning. The sun will not be shining when you start. The family won't wait for you to film them getting out of the train and you won't have time to arrange your apparatus. That is why I say "Make a film, don't take one!"

What I mean by that statement is that you make your film and write your

scenario after you have taken the film.

You set out on your holiday with the amount of film you can afford, and then during that time film anything you like. Always carry your camera with you if you can. Don't be afraid of looking "trippery"; everybody possesses some sort of camera.

If you see a statue you like the look of, take it. You see your sister looking picturesque against a wall, take her. But don't ask her first. If you do she will at once become self-conscious, and if it doesn't come out she will most probably make some rude remark about your photographic abilities, and if it does she will be annoyed that you did not take more.

When you have taken everything you can see, take a car and a train, because these things are always very useful fill-ups. If you are not the possessor of a car or a train take a bus, tram, or bicycle.

After your holiday you will have something to amuse you during the

winter evenings. First of all make a list of everything you have taken that is successful. Write these down in order and divide into reels.

Then take a lot of scribbling paper and arrange your film. One thing must, if possible, lead on to the next. If you find this almost impossible you can fit in your train, car, bus or bicycle. But you will find, I think, that they fit in remarkably well, causing a continuous and often amusing film.

If you take a shot of a statue of Napoleon and then directly afterwards show cousin Fitzgerald standing in approximately the same position it is sure to cause laughter. Put the sea-lions at the Zoo next to the family bathing, or father on the rubber sea-horse next to the point-to-point. I think this will be much more satisfactory than trying to keep to a fixed scenario, or just to show a continuous family snapshot album, so: "Make a film, don't just take one this summer."

# Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a separate stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

## Sulphide Solution.

What is a suitable strength for a stock solution of sodium sulphide for bromide toning?

E. L. G. (Ripon.)

A convenient concentration is 1 oz. of the sulphide in water to make 5 oz. The working solution (which will not keep) may be one part of stock solution to 8 or 10 parts of water.

## Cleaning Glass.

How can I best clean sheets of plate glass that I use for glazing prints?

F. W. E. (Torquay.)

When not in use the glass should be kept carefully wrapped up, say in brown paper, to protect it from dust, etc. It should never become really "dirty." Countless methods of preparing the glass have been suggested, many of them unnecessarily elaborate. Make up a thin cream of good plate powder and water, rub this over the glass sparingly with a small sponge, and rub off very thoroughly with a clean cloth. You will see at a glance that nothing else is necessary.

## Grammes and Grains.

In a conversion table I have it states that 1 gramme is 15 grains, and then it gives 10 grammes as 154 grains. Why not 150? There are similar discrepancies, too.

H. L. C. H. (Edinburgh.)

One gramme weighs a trifle more than 15 grs., but so little more that it could not be weighed in the ordinary way. By the time we come to 10 grammes the difference amounts to 4 grs.; and the nearest approximation to 100 grammes is not 1,500 but 1,543 grs.

## Soiled Scale-pans.

The scales with which I weigh small quantities have brass pans, and I find that particles of amidol turn black, and the pans become soiled. How should I clean them?

R. E. (Brighton.)

You should never put amidol or anything else in the pans themselves. In each pan you should put a watch glass,

which can be kept clean easily, or a disc of paper, the one on which the chemical is put being thrown away after use. Clean your pans with fine emery paper, and keep them clean by one of the methods suggested.

## Stereoscopic Pictures.

I have been told that stereoscopic transparencies give a more realistic effect than prints. Is there any truth in this?

C. J. W. (Shetland.)

It is generally admitted that transparencies are much more effective than prints in the stereoscope, and this is certainly our own opinion.

## Position of Filter.

I cannot fix a filter on the front of the lens of my reflex; should I get the same results if it was fixed at the back of the lens?

I. E. (Purley.)

A colour filter will work equally well in front of the lens, behind it, or between the combinations. When the filter is at the back of the lens it generally alters the focus slightly, but this will not matter in the case of a reflex where you see the actual definition that you are getting, and can focus correctly.

## Marks on Film.

I enclose a negative which has a portion of the glazing destroyed. Can you give the reason and the remedy?

L. B. (South Norwood.)

The negative is an excellent one, and we doubt whether the matt markings on the back would show either in contact printing or enlarging. So far the only remedy we have found is to lay the negative, film side down, on a piece of glass and polish up the back with a soft rag very slightly moistened with methylated spirit. We have found a trace of Baskett's reducer even more effective than the spirit. The markings only occur in certain cases, and are due to contact between the film and the backing-paper.

## Exposure Data.

Could you persuade those sending prints for criticism to give information as to exposure, etc.? This would be useful to beginners.

E. H. H. (Birmingham.)

We sometimes publish exposure details, and so on, when they are available; but in the vast majority of cases even the authors of the pictures have no such particulars. Moreover, their value is strictly limited, as it is a comparatively rare thing for all the possible factors to be the same in different cases.

## Colouring Prints.

I have tried colouring prints with water colours; what other methods are there? Which is the most perfect?

J. C. (London.)

Prints can be coloured by means of water-colours, oil colours, dyes, pastels, or coloured pencils. Good work can be done by any one of these methods in skilful hands. It is quite out of the question to say that one is more perfect than another. The skill of the artist is of more importance than his materials.

## Paper Negatives.

Will you let me have a method of printing from paper negatives without the grain showing?

R. B. (Woodford.)

Negatives on bromide paper are generally made more translucent by applying vaseline oil or otherwise; but there is no possible means of getting rid of the natural grain of the paper entirely.

## Mountant.

Will you let me know of a good glue for fixing prints in an album? I want a glue that has not a tendency to squeeze out from the edges of the print when being fixed?

J. H. (Rotherham.)

You should not use glue for mounting prints, but one of the usual dextrine mountants, like Johnson's or "Fixol." If this is applied in the proper manner, there is no sign of any squeezing out at the edges. A very thin, even coat of paste must be well rubbed into the back of the print. There should not be enough to squeeze out when pressure is applied.

## Spoilt Film.

The enclosed negative is one of several on fine-grain panchromatic film. Why has it developed as a positive?

R. M. G. (London.)

The trouble with your films is that they have been exposed during development to a light that is not safe for panchromatic material. Probably you are a new reader or you would have seen the matter explained and illustrated. You must learn the correct procedure with panchromatic material, or you will have repeated trouble.

## Making Enlarger.

Can you refer me to a recent article on making a vertical enlarger, or to a cheap book on the subject?

A. S. (London.)

We cannot refer you to any articles on making a vertical enlarger, as there is so much variety in enlarging apparatus, that any particular one described in detail would have only a limited appeal. Further, we do not know of any literature whatever on this subject. A book on enlargers and how to make them would have to be both large and costly, far more so than its sales would warrant.

# Special Summer Competition

FOR THE BEST SHORT CINÉ FILM TAKEN BY AN AMATEUR OF

## A CHILD-LIFE INCIDENT

### "HOME MOVIES" ARE GIVING

1st Prize.....	£10
2nd ".....	£5
3rd ".....	£3
4th ".....	£1

And 12 Consolation Prizes of 10s. each.

### WE ARE GIVING

1st Prize.....	£10
2nd ".....	£5
3rd ".....	£3
4th ".....	£1

And 12 Consolation Prizes of 10s. each.

In connection with the "HOME MOVIES" Summer Ciné Competition, we are doubling the prize money given by the Editor, providing the prizes are won by amateurs using a 9.5 "CORONET" Ciné . . . thus should the winner of the first prize, for instance, have used a "CORONET" Ciné Camera, he will receive £10 from "HOME MOVIES" and £10 from "CORONET," and so on all the way through the prize list.

**ENTER TO-DAY FOR THIS SIMPLE COMPETITION.**

Any photographic dealer will only be too happy to demonstrate a "CORONET" Ciné Camera to you. This wonderful little machine will give you splendid films quite equal to those obtained by apparatus costing double and treble the modest price of 75/-

# THE London Salon of Photography 1935.

**SENDING-IN DAY, Wednesday, September 4th.**

THE TWENTY-SIXTH EXHIBITION promoted by the Members of the London Salon of Photography will be held at The Galleries of the Royal Society of Painters in Water Colours, 5a, Pall Mall East, London, S.W.1, from SATURDAY, 14th September, to 12th October, 1935.

## CONDITIONS OF ENTRY (Please read carefully).

No. 1. Pictures from exhibitors in the British Isles must not be framed; but may be mounted. Each picture must bear on the back, clearly written—(a) name of artist; (b) number and title of picture; corresponding to particulars on the Entry Form.

No. 2. When mounts are employed, they should conform to the following sizes—25×20, 20×16, or 15×12, but no mount to exceed 25×20; and it is suggested that white or light-toned mounts be employed wherever possible.

No. 3. Pictures from abroad must not be mounted (or framed), but should bear full particulars as above.

No. 4. Pictures which are sent unmounted will be suitably mounted by the Salon Committee, and all accepted pictures will be shown under glass.

No. 5. All pictures should be sent by parcels post, packed flat, and properly protected with stiff cardboard and adequate wrappings, addressed to: THE HON. SECRETARY, THE LONDON SALON OF PHOTOGRAPHY, 5A, PALL MALL EAST, LONDON, S.W.1.

No. 6. The sending-in day is Wednesday, September 4th, 1935. All pictures for the Exhibition must arrive at the above address on or before this date. Exhibits may be delivered by hand at the Gallery on this date only.

No. 7. The Entry Form, properly filled in, must be sent with the pictures, together with entry and packing fee of 5/- (this fee covers any number of pictures from one exhibitor).

No. 8. To avoid Customs complications, all entries from without the United Kingdom must be sent by post and without prices marked on the prints. Packages containing such entries should be clearly labelled: "PHOTOGRAPHS FOR EXHIBITION ONLY. NO COMMERCIAL VALUE. TO BE RETURNED TO SENDER."

No. 9. All pictures sent by post will be repacked and returned carriage paid, after the close of the Exhibition.

No. 10. In view of application being made from time to time to The London Salon of Photography for permission to reproduce pictures from the walls of the Gallery, exhibitors are asked to signify on the Entry Form whether they have objection to such permission being given. The copyright, in all cases, remains the property of the authors of the prints.

No. 11. The Committee assure intending exhibitors that the utmost possible care will be taken of all work submitted, but they do not accept any responsibility for loss or damage, either during transit or at the Gallery.

The submission of pictures will be understood to imply acceptance of the above conditions.  
Due notification of acceptance of pictures will be sent out as soon as possible.

All correspondence must be addressed to the Hon. Secretary, London Salon of Photography, 5a, Pall Mall East, London, S.W.1.

**Readers of

## Business Notices Publishing

**OFFICES.**—Dorset House, Stamford Street, London, S.E.1. Telegrams: "Amaphot, Sedist, London." Telephone: Hop 3333 (50 lines).  
**PUBLISHING DATE.**—"The Amateur Photographer and Cinematographer" is on sale throughout the United Kingdom every Wednesday morning.  
**SUBSCRIPTION RATES.**—British Isles 17/4 per annum, Canada 17/4, other countries abroad 19/6 per annum, post free.  
**REMITTANCES.**—Cheques, etc., should be crossed and made payable to Iliffe and Sons Ltd. "The Amateur Photographer" can be obtained abroad from the following: **UNITED STATES:** The International News Co., New York. **FRANCE:** W. H. Smith & Son, 248, Rue Rivoli, Paris; Hachette et Cie, Rue Reaumur, Paris. **BELGIUM:** W. H. Smith & Son, 71-75, Boulevard Adolphe Max, Brussels. **AUSTRALIA:** Gordon & Gotch, Ltd., Melbourne (Victoria), Sydney (N.S.W.), Brisbane (Queensland), Adelaide (S.A.), Perth (W.A.), and Launceston (Tasmania). **NEW ZEALAND:** Gordon & Gotch, Ltd., Wellington, Auckland, Christchurch and Dunedin. **INDIA:** A. H. Wheeler & Co., Bombay, Allahabad and Calcutta. **CANADA:** Imperial News Co., Toronto, Winnipeg and Vancouver; Benjamin News Co., Montreal; Gordon & Gotch, Ltd., Toronto. **SOUTH AFRICA:** Central News Agency, Ltd.

## Displayed Advertisements

Communications on Advertisement matters should be addressed: The Advertisement Manager, "The Amateur Photographer and Cinematographer," Dorset House, Stamford Street, London, S.E.1. Copy for displayed advertisements for the issue of any particular week must reach Dorset House by the first post on Tuesday morning in the week previous. Rates and conditions will be sent upon application.

## Prepaid Advertisements

### SALE AND EXCHANGE: AMATEURS ONLY—

12 words or less ..... 1/-  
 1d. for every additional word.

### PROFESSIONAL AND TRADE:—

12 words or less ..... 2/6  
 2d. for every additional word.

Each paragraph is charged separately.

**SERIES DISCOUNTS** are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 28 consecutive, 10%; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid and posted to arrive at the Head Office, Dorset House, Stamford Street, S.E.1, not later than first post FRIDAY for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 260, Deansgate, Manchester, 3; 28a, Renfield Street, Glasgow, C.2.

Advertisements are inserted, as far as possible, in the order received, and those received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

Postal Orders sent in payment for Advertisements should be made payable to **ILIFFE AND SONS LTD.**, and crossed

& Co.

Notes being untraceable if lost in transit, should not be sent as remittances.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

**BOX NUMBERS.**—For the convenience of advertisers, letters may be addressed to numbers at the office of this paper. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charges, which must include the words: "Box 000, c/o 'The Amateur Photographer'." Replies should be addressed: "Box 000, c/o 'The Amateur Photographer,' Dorset House, Stamford Street, London, S.E.1," and these letters will be simply forwarded by us to the advertiser. It must be understood that we do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisement. Readers who reply to Box No. advertisements are warned against sending remittances through the post except in registered envelopes. In all such cases the use of the "Deposit System" is recommended.

## Special Note

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post. When sending remittances direct to an advertiser, stamp for return should also be included for use in the event of the application proving unsuccessful.

## Deposit System

Readers who hesitate to send money to advertisers in these columns may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Amateur Photographer and Cinematographer," both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods, they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in the event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For all transactions up to £10 a deposit fee of 1/- is charged; on transactions over £10 and under £50 the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, one-half per cent. All deposit matters are dealt with at Dorset House, Stamford Street, London, S.E.1, and cheques and money orders should be made payable to Iliffe and Sons Ltd.

## CAMERAS AND LENSES

**1-PLATE** Ensign Reflex, Ross Xpres f/4.5, 6 S. slides, case; as new; cost £20; take £10.—Goodall, 251, Lewisham High Rd., S.E.4. [8770]

## WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

## CAMERAS AND LENSES

**SOHO** 3½×2½ Reflex, Pentac f/2.9, F.P.A., filter, case, developing tank, £17/10.—Below.

**ADAMS'** Minex Reflex, ½-pl., Pentac f/2.9, F.P.A., filter, case, developing tank, £20.—Below.

## THIRTEENTH EDITION

# WALL'S DICTIONARY of PHOTOGRAPHY

## AND REFERENCE BOOK FOR THE AMATEUR AND PROFESSIONAL PHOTOGRAPHER

Edited and largely re-written by  
F. J. MORTIMER, Hon. F.R.P.S.

All the latest photographic principles are incorporated in the present edition, which includes up-to-date information on such recent developments as infra-red, high-speed and colour photography. The volume provides practical information in dictionary form on every phase of the subject—technical, pictorial, scientific and general, and is in itself an explanatory index to all terms, formulæ, etc. Its contents are made readily accessible by the extensive use of cross references.

# HAND CAMERAS

Third  
Edition

By R. Child Bayley

AN outstanding feature of this book, which makes a special appeal to all amateur photographers, is a number of separately printed plates, all from hand camera negatives by the author. These are selected to show the very wide range of subjects accessible to the snapshotter, from pure landscape to tele-photographic portraiture.

Though primarily written for the beginner, "Hand Cameras" contains much of interest to the advanced worker, and should be in the working library of all who would attain to the highest degree of artistic excellence in their work.

# THE FIRST AND FOREMOST LEICA SPECIALISTS

... YOUR SEARCH FOR THE PERFECT LEICA SERVICE ENDS AT BOND STREET—WE KNOW AND HOLD EVERYTHING LEICA!

No matter what Leica lens you require—Hektor, Elmar, Summar, etc.—we have them all. Every other accessory, too, including 12-exposure films, filters, angular view-finders, flash outfits, developing tanks, etc. We are always willing to answer any Leica query, and give the expert advice which is based on over ten years' Leica experience.

EVERY LEICA  
CAMERA IS  
ALWAYS AT  
BOND ST.!

**LEICA III** The wonder camera for holidays. Makes a record worthy of cherishing. With f/2 Summar lens.... **£39:10:0**  
Nine monthly payments of 92/2.  
With f/3.5 Elmar lens..... **£30:10:0**  
Nine monthly payments of 71/2.  
**LEICA II** With f/3.5 Elmar lens..... **£26:10:0**  
Nine monthly payments of 61/10.  
**NEW LEICA IIIa** speeded up to 1/1,000th sec., with f/2 Summar lens. (Chromium only)..... **£43:0:0**  
Nine monthly payments of £5 os. 4d.

## 16-MM. MOVIKON

The new Ciné Camera embodying features hitherto not found in amateur ciné apparatus. Coupled distance meter. Compensation of parallax. Delayed-action release. Footage indicator. Button operating "direct-focus-on-film" mechanism and angle view-finder. Shutter speeded 1/25th to 1/200th sec. Zeiss Sonnar f/1.4 lens

**£98 : 10 : 0**

Nine monthly payments of £11 10s.

## FOTH-DERBY CAMERA

Takes 16 pictures on standard V.P. Roll Film. Very light and compact. Fitted with Foth f/3.5 or f/2.5 anastigmat and focal-plane shutter, giving instantaneous exposures from 1/25th to 1/500th sec., also time exposures. Delayed-action movement fitted to the shutter allows the operator to be included in the picture. Fitted with new type view-finder.

Foth f/3.5 lens..... **£5:5:0**

Foth f/2.5 lens..... **£7:5:0**

Nine monthly payments of 12/3 or 16/11.

## ZODEL LENS HOOD

(Patent applied for) allows you to take pictures almost directly into the sun. Combining portability with light weight and the greatest possible measure of protection. Telescopic and folds flat for carrying. Eliminates internal reflections from the camera bellows, and ensures brighter pictures. Adjustable screw fixing. In two sizes: "A," to suit lenses from 1 to 1 1/2 in. diameter; "B," for lenses from 1 1/2 to 2 in. diameter, 7s. 6d. each.

Filter Rings, 2s. 0d. each.

## NEW SUPER IKONTA

Takes 12 exposures on 3 1/2 x 2 1/8-exposure Roll Film. Double exposures impossible. Zeiss Ikon latest pattern rotating wedge distance meter coupled to lens focussing. Rapid Compur shutter. Modern die-cast body. Elegant construction. With f/3.5 Zeiss Tessar lens.

**£25 : 5 : 0**

Nine monthly payments of 59/-.

## THE LEITZ FOCOMAT ENLARGER

Specially made for Leica enlarging. Has automatic focussing, and enables you to make perfect pictures up to any size from 3 1/4 x 2 1/4 to 15 x 10 in. Diffused illumination gives soft harmonious enlargements.

For use with your own Leica lens.

**£16 : 6 : 6**

Nine monthly payments of 38/2.

## EASY TERMS & EXCHANGES

Buy your camera or enlarger on nine equal monthly payments. First payment secures your purchase. High allowance on your used apparatus in part exchange. Send 2d. postage now for free lists.

## DON'T FORGET!

Wallace Heaton's Great

## "LIFE PHOTOGRAPHS" COMPETITION

Holidays offer infinite scope for getting ideal prize-winning snaps and as long as they contain human life interest they can be entered. No entry fee, no restrictions. Send in as many efforts as you like, but don't forget to put your name and address on the back of each one.

## FIRST PRIZE - £10:10:0

Second Prize £5 : 5 : 0 Third Prize £2 : 2 : 0

Hundreds of Prizes of 10/6.

(Winning negatives become our property.)

As advertisements on these covers go to press a fortnight in advance some of these second-hand items may be sold already, but similar outfits are usually available.

## BARGAINS

## A CUSTOMER WRITES . . .

Pembury, Kent.  
May 16th, 1935.

"May I draw your attention to the pleasant manner of the assistant who served me and explained the camera."

This is typical of all your salesmen and goes all the way to inspiring confidence in your customer, besides breeding that satisfaction which only a fair deal can do."

E. L. M. B.

## A Rolleiflex Picture

The Rolleiflex is unique in enabling you to get those shots which make unusual pictures. It is because you can concentrate your whole attention on the picture and forget the camera. You can see your picture actual size, and right way up, and without taking your eye off the picture you can focus, set your lens stop and shutter speed and release the trigger. The ease of dead accurate focussing and the remarkable facility with which perfect pictures can be composed, makes the Rolleiflex a master camera in the hands of the amateur. For experts its range is infinite, especially when the numerous accessories are brought into use. Fitted with New Rapid Compur shutter, 1 sec. to 1/500th and T. & B., Zeiss Tessar f/3.5 lens, **£22 10 0**. Your Dealer will demonstrate.

*Let's talk about*

No. 4 of an explanatory series describing the finest all-purpose film in the world

## SPEED

'Panatomic' is a fast film. It has all the speed you need for all normal daylight subjects, and it is fast enough for night-time 'shots', too. Indoor snaps at  $f4.5$  by the light of one "Photoflood" Lamp are possible with 'Panatomic.' (For 'shots' requiring extreme speed, Kodak Super Sensitive Panchromatic Film is unsurpassed.)

## RELATIVE SPEEDS

REGULAR

PANATOMIC

### BY DAYLIGHT

'Panatomic' is fifty per cent faster than regular Kodak Film.

REG-  
ULAR

PANATOMIC

### BY ELECTRIC LIGHT

(Half-watt Tungsten)

'Panatomic' is four times as fast as regular Kodak Film.

NEXT WEEK: ANTI-HALATION BACKING

## NATURAL COLOUR PHOTOGRAPHY

**N**ATURAL colour photography is now available to all photographers without the use of special apparatus and at very little extra cost. Dufaycolor Roll Films and Film Packs are as simple to use as ordinary films, yet without the use of special filters they produce transparencies in beautiful natural colours. On sale at all approved Ilford dealers.

**N**ATURAL colour photography is also available for the amateur cinematographer for 16 mm. cameras. Dufaycolor cine film is sold in 50 feet and 100 feet daylight loading spools. No additional attachments are required, but a plain single-colour daylight compensating filter is supplied free with each carton of film.

WEDNESDAY, SEPTEMBER 4TH, 1935.

Copyright—Registered as a Newspaper  
for transmission in the U.K.

VOL. LXXX. No. 2443.

ENTRIES have been arriving in great numbers for our special Competition for Novices, which has been announced week by week during the summer, and readers who have not yet entered for this competition should note that the closing date is Saturday next, September 7th. The final coupon appears in this issue. The prizes, as announced elsewhere, consist of supplies of roll film or plates (if the winner happens to use plates), which will be supplied regularly for varying periods. These prizes will not only enable the prizewinners to continue their photography throughout the autumn and winter months, but in the case of the first prize—when two roll films are supplied every week for a year—the winner will be assured of materials right through the holiday season for 1936. Coupons have appeared every week for several months, and the only condition is that the readers who compete are novices who have not yet won an award in any competition. The entries are restricted to contact prints, but the smallness of the prints (which may be mounted if necessary) will not affect their chance of winning a prize.

### A Part of Hospitality.

A friend welcomed us the other day to his cottage on the ridge of the South Downs. We had no sooner climbed to the summit and taken our breath and had a look round on the map of Sussex spread below than he brought out his camera and demanded as a condition of admission indoors that he must be allowed to make our picture. He told us that he did this to everybody who sought him out in his high retreat. It was a part of his

## TOPICS of the Week

### A Weather Forecast FOR THE WEEK

By D. K. BARTLETT.

#### THURSDAY, SEPTEMBER 5th.

A mainly fine day with sunny periods, average temperatures and a clear atmosphere can be expected. There will be some cloud and probably an occasional shower in the West.

#### FRIDAY, SEPTEMBER 6th.

While a good deal of fair weather and bright sunny intervals are likely in the North of England, cloudy and breezy weather will occur in the South, with occasional showers, especially in the South-West, and thundery conditions in the South-East.

#### SATURDAY, SEPTEMBER 7th.

It will continue fair weather over the South, Midlands and East Coasts, with a fresh breeze from the channel and Wales, where showers are likely. Mists and a moisture-laden air will occur on the East Coast of Scotland and South Ireland.

#### SUNDAY, SEPTEMBER 8th.

Rain and misty weather will occur in the South-West of England off Cornwall and Devon Coasts across to Ireland. It will be mainly fair weather elsewhere to the North-Eastern Coasts of Scotland, where rain and mist will be likely.

#### MONDAY, SEPTEMBER 9th.

Some fairly bright and sunny periods, especially along the East Coast of England and in the South-West, but thundery conditions will attend also.

#### TUESDAY, SEPTEMBER 10th.

Mainly fine and good sunshine periods with a fair amount of clouds and perhaps early haze or drizzle in Scotland and South-West of England.

#### WEDNESDAY, SEPTEMBER 11th.

Similar weather is probable generally over the British Isles. Fairly good weather, some cloud and breeze and some mist or haze occurring in the Eastern Counties early.

ritual as host, just as necessary and as courteously done as to bid his guest refresh himself at the table. Afterwards he sent us some admirable prints, keeping, of course, copies for himself, so that he is fast accumulating a pictorial record of his various friends as they come to see him in his own domain. This camera-welcome, as he calls it, is a little custom which deserves to be encouraged for the pleasure that it gives both to him who bestows and to him who receives.

### Exhibitions Eighty Years Ago.

Eighty years of photographic exhibitions have made people know what to expect, and now the public goes to them thinking nothing of seeing the whole world mirrored on four walls. But what kind of impression one of the earliest photographic exhibitions in Pall Mall, in 1855, made upon such a serious person as a writer in the "Athenæum" of that period may be gathered from this passage: "We have scenes, not copied, but literally [*sic*] brought away bodily, by solar enchantment, from Normandy and Venice, Stamboul and Egypt." He comments that stonework is copied to perfection, tree trunks with equal success, though the smaller twigs are apt to turn into dark wires or feathery fingers. He also says that water seems to defy these "rulers of the sun," remaining turbid, foggy or metallic, its transparency gone, and grass remains microscopic and confused. Even in the exhibition of 1855 this enthusiast found a serious blemish—the "ink-blot picture" as he calls it—while there were skies which appeared to be suffering from skin diseases. On the other hand, some pictures are so "bossy"—now, what

did that word mean to the early Victorian?—"that they compel an appeal to touch to verify or refute our sight." Ah; then probably "bossy" has nothing to do with "master," but with the root of the word "embossed." The details "stood up." This writer sees the future of photography bathed in rosy light, which, it may be hoped, time has not disappointed. With this medium, he says, everyone may be an artist in his spare moments without toiling for years over laborious mechanism. The simplest student may become a discoverer, and his results be always greater than he had expected. In fact, photography might be to art what printing had been to literature.

### Why Television Tarries.

We notice that an excellent new book about television is issued to the world in a publisher's wrapper which, though it is done in photography, must be considered prophetic rather than actual. The design shows, in the upper part, a scene of movement and life in London, and in the lower part a man regarding his televiser and beholding in the illuminated frame the same scene on a smaller scale, but perfectly reproduced in every detail, somewhat after the style of the scene in the view-finder. Perhaps this may be considered a new type of publisher's blurb, but we hope, elusive as television is, that it may soon become a reality. It is

not always realised why the transmission of visual images by radio is so much more difficult than the transmission of sound. Very largely it is because the ear is a much less acute and a much more tolerant instrument than the eye. The ear, listening to sound being transmitted by wireless, will forgive or hardly be conscious of any number of disharmonies and falsities, whereas the eye in what it sees cannot overlook the smallest distortion or see a line straight when it is twisted. When people express impatience and wonder whether television will ever be ready for picking they ought to remember this fundamental and inescapable difference between the two senses.

## "The Amateur Photographer" EXPOSURE TABLE—September

EVERY MONTH a brief exposure table will be provided for the assistance of our readers in their practical work. A glance at the current approximate exposures as here given will serve as a reliable guide for most purposes. The subjects will be varied to suit the time of year. The following exposures will serve as a working guide for any fine day during the month, between the hours of 10 in the morning and 2 in the afternoon, with the sun shining, but not necessarily on the subject. Stop used, f/8. The exposure should be doubled if the sun is obscured, or if stop f/11 is used. For f/16 give four times the exposure. For f/5.6 give half. From 8 to 10 a.m. or from 2 to 4 p.m. double these exposures. From 6 to 8 a.m. or from 4 to 6 p.m., treble them.

N.B.—The times given above are by "sun time." The exposures, therefore, which are laid down as suitable for 2 to 4 p.m., for instance, will be those to be given between 3 and 5 p.m., by the clock, during "summer time."

SUBJECT.	Ordinary.	Medium.	Rapid.	Extra Rapid.	Ultra Rapid.
Open seascapes and cloud studies .. ..	1/25 sec.	1/40 sec.	1/75 sec.	1/100 sec.	1/120 sec.
Open landscapes with no very heavy shadows in foreground, shipping studies or seascapes with rocks, beach scenes ..	1/15 "	1/25 "	1/45 "	1/60 "	1/75 "
Ordinary landscapes with not too much foliage, open river scenery, figure studies in the open, light buildings, wet street scenes	1/8 "	1/12 "	1/25 "	1/30 "	1/40 "
Landscapes in fog or mist, or with strong foreground, well-lighted street scenes ..	1/5 "	1/10 "	1/20 "	1/25 "	1/30 "
Buildings or trees occupying greater portion of pictures, river scenes with heavy foliage	1/3 "	1/4 "	1/8 "	1/12 "	1/15 "
Portraits or groups taken out of doors, not too much shut in by buildings .. ..	1 1/2 "	1 "	2/3 "	1/3 "	1/4 "
Portraits in well-lighted room, light surroundings, big window, white reflector ..	5 secs.	4 secs.	2 secs.	1 1/2 "	1 "

As a further guide we append a list of some of the best-known makes of plates and films on the market. They have been divided into groups, which approximately indicate the speeds referred to above. The hypersensitive panchromatic plates and films require less exposure than the ultra-rapid.

Ultra Rapid.		Rapid.	
AGFA, Special Portrait.	ILFORD, Golden Iso-Zenith.	BARNET, S.R. Pan.	BARNET, S.R.

# Making the Best of the Season's Negatives

The following article is devoted to showing photographers how to utilise their collection of summer negatives to the best advantage.

**A**MATEUR photography, thanks to modern apparatus and sensitive material, is now practised all the year round. There is no "off season," but it naturally follows that many workers make the greatest number of exposures during the summer holidays, and the present time of the year brings an accumulation of negatives to be dealt with, for print-making and exhibition purposes, etc.

It is safe to say that although most photographers go to the trouble of making contact prints from all their negatives, there are very many cases where the best is not made of the season's work.

The first thing the amateur should do after he has completed the development of his "bag" of exposures, is to examine all the negatives carefully so that each one comes under review. There will doubtless be some of first-class quality, of which the photographer is justly proud.

## Make Trial Prints.

There will be others not in the same class, which for some reason or other have failed to produce the results anticipated from them. This may be due to technical faults in exposure or development, or the picture may have been taken from the wrong angle. It is desirable, therefore, to consider each negative on its merits, and in the case of those subjects which obviously fail as satisfactory pictures, to make straight prints as soon as possible. These will show where the faults are, and how best they may be corrected, or how parts may be utilised.

Another reason for seeing the subjects in the form of prints is that in some cases when a large number of exposures have been made (particularly if the holiday has extended over a fairly long period) many of

the subjects will be of incidents or places that have been almost forgotten. These negatives are frequently a source of considerable pleasure when printed, as they will frequently be seen with almost a fresh eye, and suggest pictorial treatment that may not have been visualised at the time the photograph was taken.

It is useful in many cases, when the subject is a promising one, to make a small enlargement and, by following the suggestions that have already been made on several occasions in these pages, to select small portions that can be still further enlarged to make satisfactory compositions.

## Ways of Using.

The photographer who obtains the most pleasure, and also, it may be, the most profit from his hobby, will be found to have used it as a means to an end. There are many varieties of ways to which a collection of negatives may be put, after a set of prints have been made from them as a basis for consideration and an indication of possibilities for picture-making.

If the photographer is interested in pictorial work he has the pleasurable task of considering the possibilities of each subject. These will include the printing process, the treatment of the picture in the matter of control which may be thought legitimate or necessary, and the trimming and mounting of the print.

There are so many different ways of presenting a good subject which is as yet only in the negative stage, that the photographer has a wide field for experiment, and also one of immense interest. The keen photographer will also, from the set of prints that it is suggested he should make, be able to decide upon those to use for exhibition or com-

petition work, or home decoration.

There is undoubtedly a revival of interest in lantern-slide making, and any photographer possessing a collection of negatives of subjects related more or less to each other will do well to consider the possibilities of making a set of slides. There is no better means of showing the beauty of good photographs, and, it may also be added, no worse means of making evident the shortcomings of those which are bad.

Apart from slides dealing with subjects of a similar character, the photographer may well consider the possibilities of the pictorial slide. In the case of those subjects which are effects of light and shade, the advantage of seeing the photographic image by transmitted light is enormous. This is why some of the leading lantern-slide workers favour subjects of this character.

## In General.

By making a survey of his summer's collection of negatives in the manner described, the photographer will be certain that he has made the best of them. It is a good plan to keep prints in sets, with the resolve that the set will not be broken, and in order to ensure this there is much to be said in favour of mounting in an album. It often happens that a subject is wanted, and the print respecting it has been given away. The plan of keeping sets of prints avoids this possibility.

It is a good plan when making up a set of prints to make a list of the negatives, the number of each negative being neatly written under the print from it, and the numbers marked upon the box or packet containing the negatives numbered to correspond with the prints. This is a very simple system, but it will ensure any negative being rapidly found when wanted.

# PHOTOGRAPHY *among the* SAND DUNES

By CHAS. MORRIS.

**W**HENEVER we have an opportunity to visit a district where sand dunes are found we should take advantage of the occasion to secure some of the pictures that abound there. Here are a few practical hints on the work.

Choice of subject presents difficulties because sand dunes are difficult to isolate and compose. Sand ripples moulded by the wind, dune grass on a ridge, or the combination of such details with striking cloud formations, will provide satisfactory subjects. But pictorial results can be obtained only in full sunlight, for the sand cannot be rendered properly in flat lighting.

Several important considerations in technique arise. No attempt should be made to use a camera fitted with a delicate diaphragm shutter on a windy day; it will soon be put out of action when the sand is blowing about. The focal-plane shutter is more robust and sandproof, but while the reflex is best suited for this work, where a low viewpoint and exact focusing is often required, the revolving back should not be operated until the camera has been thoroughly cleaned after the day's work.

The box camera is the most sandproof of all, the

*Storm Brewing.*

*Sunshine and Shadow.*

*The Home of the Winds.*

simple shutter not being easily upset. Whatever camera is used, it should be kept in its case until actually required, and only when the wind drops and the sand grains settle should it be taken out.

Panchromatic backed plates or films should be used and a filter also if the tones of sand and cloud are to be registered with the proper degree of brilliance.

If an exposure meter is ever really desirable, it is amongst the dunes; exposures are extremely short, and there is great danger of over-exposure even with a box camera. The negatives

need to be developed up fairly well on account of the low contrast of the subject matter. It is preferable to adjust exposures by stopping down the lens, thereby obtaining the benefits of a deeper field of good definition.

As an example of how short exposures can be, in the case of "The Rising Cloud" (reproduced on an Art page in this issue) the lens was stopped down to  $f/16$  and the shutter set at  $1/50$ th sec. An S.G. Pan. plate and Beta filter were used and the negative was somewhat over-exposed.

In printing, the warmth and vividness of sunlit sand cannot be properly portrayed in black-and-white. Prints should be strong without loss of tone value, contact prints being made on daylight paper and enlargements on sepia-toned bromide.

Although a warm black or a sepia print, especially on a cream base, is the most effective and appropriate medium of its kind, there is no doubt that sand-dune pictures are seen at their very best in the form of a rather warm-tone lantern slide. The enlarged scene shows to great advantage, and gives wonderful realism to the texture of the sand and the luminosity of the sky.

(Other illustrations to this article are given on an Art page in this issue.)

# GET IT AT "THE WESTMINSTER"

## YOU CANNOT DO BETTER

### £5 Reduction

#### A Brand New ZEISS IKON IKONTA

Six pictures 3x2 in. for tenpence.

F/4.5 Zeiss Tessar anastigmat, ring control Compur shutter, speeds 1 to 1/300th sec., T. and B. Lens focusing. Self-erecting front. Brilliant reversible and direct-vision finders. Complete in maker's box with instruction book and wire release.

**Special Price £5:7:6**

Nine monthly payments of 12/7.  
Solid leather case, 4s. 9d.

#### The VICTORIA (Improved model)

16 pictures 2 1/2 x 1 1/2 on standard 3 1/2 x 2 1/2 Roll Films.

F/2.9 Schneider, Radionar anastigmat, delayed-action Compur shutter, speeds 1 to 1/250th sec., T. and B.

**£6:15:0**

Nine monthly payments of 15/0.

Weight 17 oz. Size 5 1/2 x 3 1/2 x 1 1/2.

Body of camera is moulded from practically indestructible plastic material, the surface being attractively finished. Leather bellows are fitted and the metal parts of camera are plated. The camera front is automatically erected into position for infinity photographs when the opening button is depressed, and the same movement opens up the optical direct-finder on the side of camera. Focusing adjustment for near views is provided by rotating the front lens mount according to the scale engraved on the mount.

Soft Leather Purse, zip fastener.....5s. 6d.  
Leather Case, velvet-lined, lock and key....6s. 0d.

#### THE NEW VOIGTLANDER BESSA

Takes 8 pictures 3 1/2 x 2 1/2 or 16 pictures 2 1/2 x 1 1/2 on standard 3 1/2 x 2 1/2 roll films, 620 or 120 size.

New design base-board which ensures perfect rigidity. Unique trigger release fitted under the base-board. Supplied in 8 models.

PRICES:

F/6.3 Voigtar anastigmat, Pronto 3-speed shutter.....£3:12:6  
F/4.5 Voigtar anastigmat, Pronto delayed-action 3-speed shutter.....£5:7:6  
F/4.5 Voigtar anastigmat, delayed-action Compur shutter, speeds 1 to 1/250th sec., T. and B.....£7:5:0  
Nine monthly payments of 16/11.

# INTENSIFYING NEGATIVES

## *by the Physical Method*

By  
E. BARWELL.

Many amateurs at this time of year are finding that their summer exposures have not produced the perfect negatives they hoped for. In many cases the images are thin and would be improved by some method of intensification. The following can be recommended as reliable and simple for the purpose.

THE method of physical development for obtaining an ultra fine-grained negative was described in *The Amateur Photographer* quite recently. The method of physical intensification, however, is not nearly so well known.

Physical development has had the wholly undeserved reputation of being difficult to carry out, and it may well be that these difficulties—quite imaginary—have become associated with the corresponding method of intensification.

### Advantages.

There is no increase in grain size after intensification by the physical method.

Intensification is completed in one operation and may be stopped at any degree. Mercuric iodide is the only chemical process enjoying these advantages but, unfortunately, it has a truly disastrous effect on the grain of the emulsion.

Like physical development, the process works by depositing silver on the image proportional to the amount of light which has been allowed to act thereon. It will be evident, therefore, that the resultant image is composed of pure silver and not some doubtful combination of silver, chromium, lead or mercury. The immediate result of this is that the intensified negative may be afterwards subjected to any

of the chemical processes which an unintensified negative may receive.

This is probably the safest of all intensifiers, a point which will be of interest to those who possess valuable or irreplaceable negatives. Provided that the simple directions are strictly observed, and that the negative is *perfectly free from hypo*, there is no risk of straining, softening of the emulsion, or any other disasters.

Finally, the results are quite permanent, which cannot be said of many intensifiers—especially those dependent on mercury for their action. The process is equally suitable for negatives developed chemically or physically.

### The Process.

Two stock solutions are required as follows:

#### A.—STOCK SILVER SOLUTION.

Silver nitrate (crys.)	..	240 grs.
Soda sulphite (anhydrous)	1	oz.
Hypo (crys.)	..	1200 grs.
Water to make	..	16 oz.

Distilled water is to be preferred.

#### B. 10 PER CENT AMMONIA SOLUTION.

Strong ammonia (880)	..	1 oz.
Water to make	..	10 oz.

The A solution must be carefully prepared as follows: Dissolve the sulphite in 5 oz. of water and the silver nitrate in a separate 2 oz. of water. Add the silver solution to the

sulphite solution, stirring all the time until the white precipitate dissolves. Next, dissolve the hypo in 5 oz. of water and add to the previous solution, stirring all the time. Finally add water to make up to 16 oz. Both these solutions keep well—especially if distilled water is used. The bottles must be kept well stoppered.

To make the working bath take 1 oz. of the A solution and dissolve in it 10 oz. of metol, after adding 4 oz. of water. Then, and not until everything is ready for action, add  $\frac{1}{2}$  oz. of the B solution, pour into a *perfectly clean* dish and place the dry negative therein.

In about twenty minutes or half an hour the negative will be about doubled in strength, and may be examined after rinsing with water. The process may, of course, be stopped at any stage, but the negative should on no account be kept in the bath until it is exhausted. This is indicated when the solution commences to clear on the surface; a properly prepared bath takes about one hour to become exhausted. If the negative is removed within forty minutes all danger on this score is obviated.

That is the complete process; it could hardly be more simple, and it is evident that here is a system well worth investigation by the serious amateur, especially the miniature camera user.

## Dodging Grain when Enlarging

By  
A. P. E. KENT.

IN spite of the extensive use of fine-grain films and developers, the amateur often possesses really good negatives that simply will not give him the degree of enlargement he requires. The following are methods of toning down grain when enlarging.

The first thing to remember when enlarging a negative that is known to be grainy, is, never use a glossy or highly-glazed paper. The use of a rough-surfaced paper will often be sufficient to destroy that grainy look, without having to resort to any of the under-mentioned dodges.

If the use of a rough surface does not remove the grain, the next thing to try is to put a piece of finely ground glass between the light and the condenser. As an alternative to ground glass, a piece of flashed opal glass may be used.

In the case of miniature enlargers, instead of the above, a diffusion disc, such as is supplied by Messrs. Kodak, should be clipped in front of the lens.

If even the measures described above do not subdue the grain, the following dodge should be tried, if the negative is on a film and a vertical enlarger is used. A pool of glycerine is poured on one of the negative support glasses, the negative is placed on this, and another small pool of glycerine is poured on top of the negative. The result is that the negative is sandwiched between glycerine. Enlargement is then carried on as usual, and the grain in the print, except in extreme cases, will be most effectively reduced. The glycerine can be cleaned off the negative with wood naphthol or spirits.

If the above measures do not subdue

the grain, or a huge degree of enlargement is required on glossy paper for Press or other purposes, the following method can be tried: A print is made by contact in diffused light from the negative on to a slow ordinary plate. This is developed and fixed in the usual way. This will bear a positive image. A print from this positive is then made on a lantern plate, also by contact in diffused light, and the plate developed and fixed in the usual manner. This new negative will have a much finer grain than the original, and will stand a high degree of enlargement.

In conclusion it may be said, that although grain may be subdued by the methods enumerated above, it is far better to take a little extra care during the development of the original negative, and to obtain a grainless image.

September 4th, 1935

# Photographing

By JOHN COLE.

(Assistant Scoutmaster, "Leander" Sea Scouts.)

*At the "Cook-house."*

By having a knowledge of the average day's activities beforehand you will assume a primary scouting quality and "be prepared" in advance to get the best out of various situations. Naturally, different troops have different ways of working, but you are unlikely to find any which depart substantially from the following essential routine:

The cooks will probably "show a leg" at about 6.30 a.m. Every wise lad will be up by half an hour later, for if he is not and a pond is near he will be the central figure in a ducking ceremony which will provide the guest with his first record. The cooks start by getting the fire going, and if the morning is hazily

**D**URING the latter days of summer and early days of autumn it is really difficult to take a holiday anywhere in England and not be within easy walking distance of a Scout camp.

There are several reasons why Scouts form such splendid subjects for the photographer. The main one is that they are human material of a peculiarly bubbling and spirited brand.

The photographer who decides to exploit Scouts will find it helpful to bear in mind one or two tips. When there are several camps from which to choose, it is as well to cast an eye over all of them before deciding on any special one, because the same standard of camping is not observed by every troop. Some troops bring with them much more evidence of their town origin than others. Naturally, those that contrive to turn nature to their use are considerably more attractive to the photographer.

First, the Scoutmaster, or, in his absence, the assistant in charge, should be approached. The best time is about 9.30 a.m., immediately after the camp has been cleaned up, and before either groups or the whole troop have left the camp on some excursion or other.

It should immediately be made clear to him that you are an amateur photographer, and not one of the professionals who pester many camps wanting to take groups with the object of selling prints to the boys.

If you are one who can unobtrusively fit in with Scout ideas, it is an excellent plan to ask the Scoutmaster if you may spend a complete day with the troop. By doing so, you will be able much better to judge the photographic values of its varied activities. If you "go the whole hog" and find yourself sufficiently popular to get invited actually to spend a night under canvas in the officers' tent, then your chances will be greater still.

*Preparing the Meal.*

*On the Watch.*

sunlit a fine study against the light may be secured. Do not be deceived by the apparent brilliance of the morning sun. Expose fully, and preferably on panchromatic material. Simultaneously with the preparation of breakfast, toilet activities are going on apace elsewhere.

Some good fun usually occurs around the washing trough or bucket, and the camera should be put on the scent here.

Next comes a very important item—breakfast itself. In the best camps this will be consumed from nature's table, although a surprisingly high standard of comfort and convenience will probably have been provided by means of numerous improvised gadgets.

After the meal comes a scramble to clean and tidy up in time for parade and prayers, and the visitor would be well advised to keep his camera in the background just now so as not to impede activities.

# Boy Scouts

After prayers, the orders for the day are usually given out, and then the boys will go off for games or Scout work, either as a troop or in patrols, which are groups of about seven. By accompanying a patrol, innumerable chances of securing charming studies will be sure to present themselves, and once you gain the confidence and goodwill of the Scouts you will find them patient in posing for you and, in fact, keen to help you in every possible way.

In most camps dinner is made an evening meal. Thereby the whole day is left free for excursions and the like—except so far as the cooks for the day are concerned; they have to return fairly early in the afternoon to get the fires going and to commence

*The Close of Day.*

*Pushing off.*

preparing the meal. The photographer will do best to return with these cooks. In the afternoon, effects can be obtained which are quite different from those secured at the early morning meal, and this apart altogether from the fact that the light is of a much more helpful quality, permitting the use of faster speeds or smaller stops.

At this juncture, keep a weather eye open for groups peeling potatoes or apples; for wee kiddies struggling to fan up an obstinate fire; for the ceremony of basting the roast. In fact, for every one of the dozens of human incidents which inevitably abound. When the troop returns and consumes the results of the cooks' labours (to the accompaniment of remarks as uncomplimentary as they are traditional) almost certainly some more "shots" of ravenous youth will be seen.

Now the light will be getting photographically very poor. Nevertheless, although you are not camping again to-night, stay on to see if any sunset effects or camp-fire opportunities present themselves. Of course, it is possible to take flash-light photographs inside the tents, but it is extremely unlikely that the Scoutmaster will be prepared to take the risk of firing the tents by granting you permission to let off a flash in them. However, do not overlook the very pleasing effects which, during the day, are to be had by setting up a

tripod in the tent and framing an outside view in its entrance.

Almost all that has been written deals with Scouts in their summer camp. That is because camping is the aspect of scouting which holds most possibilities for the photographer during the present month; but it should not be forgotten that, all the year round, the activities of your local Scout troop are full of photographic interest.

By the way, do not forget that the promise of a set of prints for the troop log-book will go a long way towards making you welcome.

Naturally, you will want to make sets of prints for yourself, too. If you have several opportunities of collecting Scout photographs, all the better, as you can gradually build up a most interesting and varied set of pictures. It would be well to classify these according to the different troops, methods and surroundings. Contact prints will be adequate for most of the subjects, but some degree of enlargement will enhance the effect of others; and it is more than likely that you will secure some prints

up to exhibition standard.

In conclusion, it should perhaps be explained that some of the photographs illustrating this article are of Sea Scouts, because my own troop is a Sea Scout troop.

*Coming Ashore.*

# News and Reviews.

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS

The Professional Photographers' Association Exhibition of Photography in Commerce and Industry was opened at the Prince's Gallery, Piccadilly, W.1, on September 3rd by Sir Charles Higham. The exhibition remains open for a fortnight and will be followed by the exhibition of portraiture by members of the P.P.A. as in previous years.

In our last Empire and Colonial Competition the award for the best collective entry went to the Johannesburg P.S. We hear that twenty-four members of the club duly celebrated their victory by a dinner and other jollifications. Every item on the menu bore the title of one of the prints entered.

The Goldi miniature camera, although made for the V.P. roll-film size only, is supplied in a complete range at all prices from £4 to £10 10s. The model tested, retailing at £7 7s., was fitted with an f/2.9 Zecanar anastigmat lens in Compur shutter, giving sixteen exposures, 3×4 cm., to the spool. Other models are available giving eight exposures. On pressing a button the lens front flies out immediately into position. It can hardly be called self-erecting, since the lens panel is always parallel to the back and is not hinged to the baseboard. This allows for a lazy-tong support, which, together with a very strong spring, gives an extremely rigid front. Although the front opens quicker than most cameras, provision is made to prevent suction on the film, which is kept flat by a suitable pressure pad.

Tested on all subjects at all apertures, it yielded negatives of extremely sharp definition and quality, sufficiently good for big enlargements.

The focussing, as with all models, is set by revolving the front lens component, and covers all distances from four

feet to infinity. The direct-vision viewfinder is of the double-glass type and is perfectly accurate for angle of field. The finish throughout is excellent, all edges and corners being finished in bright nickel, while the light weight of twelve ounces and overall size of 1½×2½×4½ in. makes it a pocketable camera ready for all types of subjects. Luminos, Ltd., 22, Bartlett's Buildings, Holborn Circus, E.C.4, are the London agents.

## Shrewsbury Photographic Society.

—At a large and enthusiastic meeting held in the Shrewsbury Technical College on Wednesday, August 7th, under the chairmanship of Mr. A. E. White, it was decided to proceed with the formation of the above society. A temporary committee was appointed to carry out the arrangements necessary for the inauguration of the society, and to arrange for the opening meeting to take place early in September. The committee desire it to be understood that everyone interested in photography or cinematography will be welcomed as members of the society. Further details will be announced at a later date, but in the meantime enquiries should be addressed to the Secretary, Mr. H. J. Gornall, 5, High Street, Shrewsbury (Tel. 3060), or any member of the committee.

Ciné enthusiasts who are considering renewing their projection screens in readiness for the winter evenings will be interested in the new Vauxhall Silver Screen. Mounted on rollers, the screen, which measures 40×30 in., is made of substantial canvas, and has a perfectly flexible surface. Painted bright aluminium, and neatly bordered with flat black, the screen "holds" and shows the picture extremely well, enabling it to be viewed from all angles. It is being

sold by the Camera Co., 320, Vauxhall Bridge Road, London, S.W.1, at 11s. 6d., which is remarkably low in view of its quality and finish. By post, 1s. 3d. extra.

With regard to the Dufaycolor process we learn from Messrs. Ilford that working instructions are not issued with the roll films, but only with the film packs. These instructions will be forwarded, if required, by Messrs. Ilford, but the assumption is that users of roll film will wish the processing to be done for them.

The sub-standard ciné film, thanks to the enterprise of various leading manufacturers, is providing another channel of education that has already proved itself to be of immense value. A new handbook on the subject, entitled "The Cinema in Education," has been written by D. C. Ottley, an authority on cinematography, and recently published by Routledge & Sons at 3s. 6d. It should be read by all teachers who wish to gain an insight and practical knowledge of the use of cinema in the schools.

"Profitable Photography," a new handbook by W. Stewart, just published by Pitman's at 2s. 6d., is aptly described as "a guide for the amateur photographer who wishes to enter the commercial market." The author, who is a Production Manager of a large firm, gives helpful and practical advice on how to make attractive photographs, and the very necessary conclusion on how and where to sell the prints, even to supplying the names and addresses of the best markets. Attractively printed, with numerous illustrations, it is packed throughout its 100 pages with valuable hints and tips, and should prove a good investment to every enterprising photographer.

## THE WEEK'S MEETINGS

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

### Wednesday, September 4th.

Rochdale P.S. Discussion on Developers.  
Stockport P.S. "Figure Studies." Miss Kate Smith.  
Worthing C.C. Washington to Sullington.

### Thursday, September 5th.

Hammersmith H.H.P.S. Jumble Sale.  
N. Middlesex P.S. Competitions. Members' Queries.  
Nottingham and Notts P.S. Cromford and Matlock Bath.

### Friday, September 6th.

Leigh Lit. Society P.S. Open Meeting.

### Saturday, September 7th.

Bath P.S. Bathampton.  
Blackburn and D.C.C. L. and C.P.U. Excursion—Liverpool.  
Bradford P.S. Esholt Village and Works.  
Hackney P.S. Cuckoo Pits.

THIS EXPERIENCED PHOTOGRAPHER SAYS—

PRIZE-WINNING PICTURES.—Many a photographer has set out with the purpose of achieving a prize-winning photograph and found the results not up to his high expectations. That last ounce of beauty which he was striving for is missing—he just didn't gauge the light correctly. The human eye is not designed to do this—but the Weston Exposure Meter is.

Whereas the human eye is made to adapt itself to every differing light—the Weston Meter is permanent, measuring scientifically and accurately the exact amount of light on your subject. Simple provisions are available for an analytical study of the scene. Additional arrows are provided on the calculating dial which enable the correct exposure for either the brightest object or the darkest object in a scene to be measured. This eliminates the chance of error—your whole attention can be directed towards artistic effects—no need to worry about exposure. Get this remarkable instrument to-day, and to-morrow you'll achieve the success you've always striven for.

PRICE REDUCTION. Weston Universal Exposure Meter  
£6 : 15 : 0 cash, or 15s. 9d. monthly for 9 months.

TAKES

### Eleven Pictures

### $2\frac{1}{4}'' \times 2\frac{1}{4}''$

on the usual  $3\frac{1}{4}'' \times 2\frac{1}{4}''$  Roll - film Spool.

The new Super Ikonta takes a full-size negative and possesses all the advantages of the usual miniature camera. Built-in distance meter automatically coupled to lens focussing. Automatic shutter and film-winding device prevents unintentional double exposures; large aperture ultra-rapid Zeiss Tessar f/2.8, giving microscopic definition, and Compur Rapid shutter permitting exposures up to 1/400th second, fast enough to take practically all sports pictures.

The accuracy of the distance meter built into the Super Ikonta No. 530/16 enables the use of the ultra-rapid Zeiss Tessar f/2.8, focal length  $3\frac{1}{8}''$ —the fastest lens fitted to a roll-film camera of this size—which, together with the Compur Rapid shutter (with delayed-action release) giving exposures from 1 second to 1/400th second, bring sports pictures, running, horses jumping, etc., easily within the scope of the camera. The Super Ikonta No. 530/16 takes eleven pictures  $2\frac{1}{4}'' \times 2\frac{1}{4}''$  on the usual  $3\frac{1}{4}'' \times 2\frac{1}{4}''$  roll-film spool, and the self-erecting front saves valuable seconds for the photographer. The shutter release is conveniently situated on the top of the camera, and the handsome, yet practical shape of the die-cast aluminium body makes it easy to hold steady while making exposures.

# how I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CCXCVII.

Mr.  
K. REITZ.

From information communicated to our Special Representative.

"WHEN asked by anyone the reason of my success as a picture-maker by photography, I unhesitatingly declare that it is due to enthusiasm for my work. Photography is to me the salt of life; ever since the age of twelve years I have been keen on it, and well remember my first camera, a plain square box with a lens at one end and a single wood dark-slide at the other. The lens was a famous one in those days, a Steinheil Aplanat working at  $f/12$ , and covered half a quarter-plate to perfection.

"To my great disappointment there was no instantaneous shutter to it, so I set to and made one

myself. Its working power was only supplied with a rubber band, but it worked perfectly. My first attempt at high-speed photography was to photograph the Continental Express from Victoria after it had passed through Herne Hill. I set my camera up on a high slag-heap, and waited over an hour for the express to come along. When at last it appeared amid a cloud of smoke and steam, I was thrilled with excitement, and at a distance of fifty yards I fired off my shutter, hoping for the best. But, alas! my joy was short-lived, for on looking at my camera I found I had forgotten to draw the slide.

"As a free-lance Press photographer I have tackled in my time practically every kind of subject, my favourite for many years being high-speed action photographs, which led to my working for eight years on a race-course, taking photographs of horses in action, and race finishes.

"Now the years have rolled on I confine my activities to something a little less exciting, and specialise in photographing children and animals. I adore babies; to me they are an everlasting delight and inspiration, rather trying at times, it is true, but I would not have them otherwise.

"The majority of my pictures are taken with a quarter-plate Soho reflex camera, fitted with an  $8\frac{1}{2}$ -in. focus Zeiss Tessar lens, always using the full aperture of  $f/4.5$ , and an exposure of  $1/30$ th sec., the negative material used being Kodak Super-sensitive pan. film. These are developed by the Dr. Knapp method with a pyro-metol developer compounded by myself. Just lately I have been obtaining wonderful results with an Ikonta miniature camera, using this with a twelve-thousand candle-power electric light installation.

"All my negatives are enlarged to whole-plate and larger with a vertical enlarger of my own design, and only the very best prints are passed; the rest find a home in a large dust-bin in my dark-room. Competition in free-lance Press photography nowadays is very keen, and only the best stands a chance of success."

(A further example of Mr. Reitz's work is reproduced on one of the centre Art pages.)

FIGHTING FOR THE LEAD.

K. Reitz.

# Pictorial Analysis

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"THE HIKERS," by Otto Martens.

SOMEWHAT topical in its associations and material, but appropriate enough to the present season, this picture, in view of its feeling of luminosity and light and in its representation of an effect of sunshine, nevertheless does acquire a not inconsiderable measure of pictorial attraction.

It might be said to have been made with a topical intention, but to have attained an æsthetic appeal by virtue of the prevailing conditions, for, judging by the title, the idea was primarily to show the figures actively engaged in their pursuit, while the effects in question seem to have been more or less incidental. At the same time, it may have been the case that there was an instinctive and innate appreciation of the added value imparted by these qualities and that, though the title implies a limitation of the theme, it was really they that inspired the exposure.

Be that as it may, there is little doubt about the way both are conveyed, the impression of sunlight gaining through its expression at its brightest in the figure of the girl, and the suggestion of luminosity owing its existence to the manner in which the darks of rock, figures and tree are contrasted with the lightest portion of the sky, the gradation in the latter also playing its part.

The difference in tone between the sky at its zenith and near the horizon is appreciable, and not only accords with the visual impression but tends to suggest a similar feeling of light to that created by the same circumstances in nature. Moreover, it also has the advantage of directing the attention to the lighter part, and what is placed against it. Arising out of this, it will be observed that the figures (1) derive a measure of emphasis, which enhances their importance in the compositional scheme, and, just as the effect gains from the presence of the figures, so do the figures acquire an additional

significance from the existence of the effect.

It is largely a matter of contrast of tone, the eye being attracted to extremes in juxtaposition, and, in the same sort of way, the light on the figure of the girl, coming, as it does, against the dark of the man, has the effect both of stressing their dominance

feeling is stressed by the equivalence of the weight of the masses of tree (2) and rock (3) on each side. Their shape is different and absolute symmetry is avoided, but the suggestion of formality remains, and, though there is no doubt about the forcefulness of such an arrangement, the question arises as to whether the nature of the subject renders it justifiable or not.

Traditionally, although there are notable exceptions, such a type of arrangement was reserved for subjects of a sacred character, or those in which it was intended to inspire a mood of reverence; but of late there has been a tendency to exploit the central placing in that class of composition where design is a prominent feature. It is questionable if, in the latter class, it is altogether successful, and the contention could scarcely be advanced that the subject, in this instance, can be considered to fall in the former category; but, for once in a way, or as an experiment, there may be something to be said in favour of its adoption.

Viewed in this light, it has elements of novelty, and, inasmuch, there may be a certain amount of justification, but it is doubtful if it goes so far as to warrant its more general adoption.

As an experiment, it has interest, and, at all events, a certain amount of ingenuity has been expended in the avoidance of symmetry

without losing the formal character of the arrangement; but it should not be overlooked that much of the appeal of the work rests upon the representation of the joint effects of sunshine and luminosity, and that their successful transmission depends more upon the arrangement of the light and shade than upon the placing of the elements of the subject material.

From the technical standpoint, the harmony of tone is a delightful feature that speaks well for the quality of the craftsmanship. "MENTOR."

and of bringing forward the expression of the feeling of sunshine.

This double employment of contrast—the figures against the sky and the light of the one against the dark of the other—would, alone, be sufficient to ensure their principality in almost any position; but their placing, if central, is strong in itself, and amply adequate to maintain the significance they should possess. There is, inevitably, something of a suggestion of formality arising from a placing so nearly approaching centrality, and the

# PICTURES by Novices

## SOME CRITICAL COMMENTS on the Beginners' prints reproduced on the opposite page

THE dazzle of the sunlight on the water in No. 1 of the prints reproduced on the opposite page—"At Greenwich," by A. C. Boxall—must have been an attractive effect, and it is no wonder that it invited an exposure. It is, however, questionable if the rendering conveys the impression the eye would perceive, partly on account of a measure of over-printing, and partly because the effect is spread over nearly the whole of the picture rather than being localised.

### Concentration and Dispersal.

A localisation of the light to just a portion of the water would tend towards a concentration of interest, whereas the existing state of affairs inclines towards dispersal.

If it were possible, the light at its brightest should be shown in the neighbourhood of the pier, the right-hand side and immediate foreground being placed in shadow, but such an arrangement could only be obtained by an alteration in the relationship between the line of sight and the direction in which the light is falling.

At present, the sun, although outside the field of view, is more or less in the same straight line as the line of sight. It is practically straight ahead, and, unless it falls at an angle—i.e., either to the right or left of the line in question—it is inevitable that it must be reflected from a comparatively wide stretch. On the other hand, if its direction were changed, or if the viewpoint were altered so as to vary its relationship with the line of sight, it is probable that the light would be restricted and the desired localisation of the effect attained.

Any change in the viewpoint would, necessarily, alter the arrangement, and how far this might be advisable could only have been determined at the time and on the spot.

### Change of Viewpoint.

The loss of brilliance occasioned by over-printing, which, by the way, is more marked in the reproduction than in the original, could be corrected in another print; but, in its intention, the choice of subject shows promise and a not inconsiderable appreciation of the value of an effect.

So, too, does No. 2, "Sunlight,"

by A. Best. The subject material would not be everyone's choice, but this is immaterial compared with the expression of the feeling of sunshine.

It is not the items composing the subject that count, but the influence of the sunshine upon them. As far as it goes, the work is good; but, here again, a greater measure of concentration in the sunlight would enable it to tell more effectively. It is also possible that but a slight alteration of viewpoint would bring about the inclusion of a greater proportion of shadow tone, and this is desirable both on the left-hand side and at the base.

The consequent restriction of the sunlit portion would enhance their value, and, if the spot can be revisited, it might be as well to see what can be done in this direction.

### Depth of Printing.

As far as printing is concerned, the depth is about right, but the rendering does seem a bit inclined towards harshness or an excess of contrast, and a somewhat softer grade of printing paper might be expected to provide a more harmonious result.

No. 3, "Loch Long," by R. E. Steven, is sombre in key, although over-printing has not been carried as far as in the case of No. 1. Still, a lighter print would be better, and if, upon another occasion, a greater feeling of sunlight could be incorporated, it would provide yet a further improvement upon the present rendering.

The arrangement in No. 5, "Fishermen's Cottages," by E. C. Roughton, is quaint, and the tones of the sky are nicely recorded. There would appear, however, to be little reason for the inclusion of so long a stretch of foreground, which even the presence of the boat does not relieve, and, if it could have been cut down by half an inch, and a like amount added to the sky, the pictorial proportions would have been more appropriate. Something, also, seems to have gone wrong with the way the image is defined, there being a lack of sharpness everywhere.

It may be due to incorrect focussing or movement of the camera during exposure; possibly both, but how far each is responsible it is impossible to say.

Whatever the cause, it should be carefully guarded against, for it is an effective bar to successful enlargement.

### Sunshine and Effect.

In the case of a breaking wave, such as is shown in No. 6—"A Breaker," by L. M. Dawson—a minimum of movement in the rendering of the wave is permissible as it conveys an idea of motion, whereas, if the exposure is so short that blurring of the image is absolutely stopped, the impression is too static for realism.

For the present size of picture, the degree of movement is about as much as can be regarded as acceptable. More would suggest a feeling of fuzziness, and less, if the print is intended for enlargement, would be advisable.

The representation of an effect of sunshine, however, has been well seen and caught, and the added brilliance that is gained by the display of the sunlit wave against the dark and stormy clouds behind lends the subject a pictorial value that, at least, is no less than any other on the page. Nevertheless, it seems somewhat anomalous that—although it may, in fact, be perfectly true—the foam in the immediate foreground is brighter than the foam of the breaking waves.

### Centre of Attraction.

The latter is the feature that, by its nature, should form the centre of attraction. That it does so at present is undeniable, but the reason lies in its size and mass, as well as to the prominence arising from its forceful placing. Its tone is light, it is true, but that only contributes to its significance on account of its contrast with the deep tone of the sky. The brighter tone below introduces a note of competition that the scheme would be better without, and, in the interest of unity, it could be wished that it were not quite so insistent.

It could be lowered in tone by local extra printing, and the light on the wave could be heightened by shading during the same operation, but it would need very careful workmanship in order to prevent the adjustment from becoming obvious. It would, however, endow the picture with a much greater degree of concentration and considerably appreciate the arrangement of the composition.

"MENTOR."

# With the Beginners

## NOTES AND NOTIONS FOR THE LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

### CAMERA LIMITATIONS.—II.

CONTINUING our consideration of the handicap of those who have only a cheap, simple camera available, I repeat that the handicap is by no means so serious as some people think; and that the ability to turn out satisfactory pictures does not depend to any great extent on the style or cost of the apparatus used. Just listen a minute.

If there is one photographer above all others who is hypercritical and fastidious about lantern slides it is my old friend J. Dudley Johnston. Some months ago he gave a lantern lecture at the R.P.S. on "Germany Revisited." His preference in apparatus is for a quarter-plate reflex and plates. On this occasion he supplemented it with a folding roll-film camera lent to him by the President of the R.P.S.

You will naturally visualise that camera as something of the super-de-luxe kind, jewelled in every hole, and fully corrected for latitude, and compensated for temperature. And you will be wrong. The wire finder fell off at short intervals; there was only a simple trigger release to the shutter; and as a rare and crowning refinement the lens was cracked! Did J. D. J. keep stopping to apologise for bad slides because they had been taken with the President's junk camera? Not a bit of it; and I'll be bound that no one in the audience could say which subjects were taken with one camera or the other.

Fig. 1.

It seems that the President's camera had cost him ten shillings. I think I can beat that. I have just been looking at a camera I bought some time ago, and when I put down a ten-shilling note I got twopence change. I forget what I did with the change, but I know I had it.

Mine is not a film camera, but is made for quarter-plates. It has a Plutar Aplanat,  $f/8$ , in a Simplex shutter with three speeds, T. and B.; focussing scale to 4 ft.; good rise and fall to the front both ways; large reflecting swing finder; hooded focussing screen, leather bellows and covering; and three single slides. It was bought from a dealer, too.

I have not yet used it; but one of these days I will take the same subject with this and the most expensive camera I have, and let you decide which is which.

Ordinary landscape is within the scope of almost any camera. Even if you saw the originals of the three illustrations you would not be able to decide what sort of camera I was using. It might have been a miniature pocket camera, or a whole-plate field camera, or either of the junk cameras owned by the R.P.S. President and myself. A sharp, fully-exposed photograph of a stage performance would give you at least some

Fig. 2.

information, but a simple landscape subject tells you nothing.

I took half a dozen of the cornfield subjects in about ten minutes. Had I had more time I could have done better.

I did not expect much from Fig. 1. It was just a note of the pleasant light and shade arrangement—the sort of thing the artist jots down in his sketch-book for reference.

Behind me, at the far edge of the huge field, was a cart loaded with sheaves, and I was told it was coming, across the field to about where I stood. Sure enough it began to move, and I prepared to take it. All at once it diverged into the road, and I had to change positions so hurriedly to catch it that I got camera movement. It might have been worse, and I have known people pay a long price for lenses that give a somewhat similar result on purpose. Anyhow, there is Fig. 2, for what little it is worth.

Then I took four very much like Fig. 3. The sheaves are being tossed from the cart, and another man and a couple of boys are laying the foundation of a stack. It is pretty certain that if I could have hung about long enough I might have got something better; but the surroundings were none too helpful, and the sky was pale and cloudless.

You will remember a recent article on photography in the cornfield, with some first-rate pictures. Why were they so much better than mine?

Most certainly it was not because their author had a

Fig. 3.

“better” camera than mine. Even if it were much more elaborate and expensive that was not the reason why the pictures were so superior. Perhaps they had been selected from a number taken at various times and places, and with sufficient time available for doing them justice. Certainly the material itself was better than mine—better settings, better figures, better skies. And it is equally certain that the author had the ability to “see” the subjects, and to handle them effectively. More than likely there was a picture in *my* cornfield, and I could not see it.

W. L. F. W.

## Ensuring Spotless Miniature Negatives

### SOME TIPS FOR THE BEGINNER.

ONE of the most important essentials in the case of those miniature negatives from which large prints are required is an entire freedom from spots, scratches, and mechanical defects.

It is very easy to prevent pin-holes by a careful dusting of the interior of the camera, with a small brush kept for the purpose. This should be kept in a box with a well-fitting lid when not in use.

Another common cause of spots in negatives is that the negatives are dried in a dusty atmosphere. For this reason processing of miniature films is better done at night so that drying may be done in the still hours.

It is also a good plan after washing to pass the films once or twice through a one per cent solution of acetic acid. This will remove any deposit from the washing water.

The film is then given another brief rinse, and each surface gently wiped with a piece of soft chamois leather kept for the purpose. The leather should be wet, and the rubbing done very gently. These precautions will ensure negatives which are clean. Before leaving the subject of dust it is well to point out the importance of putting the negatives away immediately after drying, so that dust will not find its way to them and cause minute scratches.

The film guides, glass plates which hold the negatives flat in the enlarger, as well as the condenser, must be free from dust.

Tank development is the ideal for miniature films. The best temperature is 60 degrees Fahr. A good plan is to fill the tank with water before the developer is poured in, the film having a preliminary soaking. This will be found a very

effective preventive of air-bells.

It is also a good plan to filter the developer when pouring the solution into the tank. For this, use two thicknesses of butter muslin. This allows the solution to enter the tank quickly, and will effectively remove any particles which become attached to the film and cause pin-holes. The developer should be frequently agitated, and many workers are lax in this matter with the result that their negatives show mottling.

The fixing solution should be filtered in the same way as recommended for the developer.

A hardening bath after fixing is also helpful in preventing mechanical damage. All vessels used should be of smooth surface or the film may be scratched. It must be remembered that the film has two sides, each of delicate character and liable to damage.

# Picture Points

## for Beginners, by RICARDO

### Regular Shapes

WE have already, in this series, discussed the problems of plain backgrounds, and the necessity of varying the tones to relieve the monotony. When the subject is under our control, such as in still life, we can remedy and alter the tones before the exposure is made, but where we have no control over the arrangement, as in landscape, etc., we have to resort to dodges in the enlarging.

There is another side to this problem that can spoil the composition, and that is where we have regular shapes of even tones. By "regular" we mean triangular, rectangular and circular shapes.

If the still-life sketch is examined we can see that the quill pen has divided the background into two rough triangles. While this is better than leaving the background as a rectangle, the two triangles are approximately equal in shape as well as area, and, being too symmetrical, they are consequently too assertive. The remedy is to vary the size of the triangles and break up, by arrangement or lighting, each of their three sides as well as the area tone.

Another example is shown in the genre sketch. The wall, bounded by the window and posters and the other sides, is too regular to be pleasant, and this calls for control work on the print to break up the regularity of the lines.

### "Record" versus

### Pictorial Prints

ALMOST without exception every beginner with a camera passes through what is known as the "record" stage. Snapshots are made of everything that comes their way, generally beginning with relatives and friends in the garden, graduating later on, to general views and incidents taken on rambles and holidays.

If the novice is keen on his hobby such elementary work soon becomes boring, and he looks for subjects that require a little thinking and planning, if they are to be photographed to their best advantage. This is the transition stage between record work and pictorialism, and, if we compare the two sketches of the cottage, we can see this difference between a

record print and a pictorial print.

The lower sketch shows the viewpoint generally taken by the beginner. As much as possible is included, and, in order to show everything, a point is taken in the centre of the house, with the focussing set

so that everything will "come out sharp" in the print.

Such a print resembles the "front elevation" on the plans, and does not show anything beyond this. In short, it is nothing but a record of the front of the house.

If we take up another viewpoint to the right, and a little farther down the road, as seen in the top sketch, what a different aspect we get! It is true that we cannot see the name of the house, or count the number of bricks, but we have a picture that can be hung on the wall, and something that has a general, rather than a personal, appeal.

### Light and its Effect on Modelling.

THE beginner will, sooner or later, come up against the term of "modelling," which must not be confused with "drawing" or "perspective." By modelling we mean the effect given on a single flat print to suggest the "solidity" of an object. An artist can always strengthen his modelling by altering his tone and colour contrasts, but in photography we are controlled mainly by the lighting on the subject. We cannot choose a much better subject for illustrating this point than a swan.

The plumage, being white, and white all over, we can see immediately how the modelling is controlled by lighting. If we have the sun behind us as the swan is broadside on, as seen in the sketch on the left, it looks almost like a piece of white card, and would look the same in a photograph.

If we take up another viewpoint and wait until the swan turns almost "end on" to the sun, the shadows thrown by the different planes of the body give the suggestion of solidity, or relief, and this is the best position to photograph it.

Thus we see that, in any subject where the general tone is light, or there is very little relief in the planes, side lighting is much better than front, and even three-quarter (45°) lighting. Such subjects as bas-relief, sculpture, coins and stucco walls, etc., as well as birds and animals, are examples.

# Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

## Simplify Your Shooting "By COMPUR."

In the short-reel subjects so popular with the majority of amateurs, it is worth while considering how the admitted inconveniences of "dope" shooting can be avoided in favour of greater simplicity.

**A**MATEURS in greater and greater numbers are coming to regard the single-reel, 450-ft. subject as the "best" for the large majority of hobby purposes. Some, indeed, have held this view since the very early days. For does not the single reel avoid the necessity for any break whatever in solo projection; does it not lend itself to the building of better, more comprehensive programmes—and, above all, does it not incline the amateur towards subjects which are at once *suitable* and intelligent enough to warrant an excuse for his hobby?

Of course, this is not to imply that good story films have never been made on one reel. "Bread," for instance, and "All is not Gold" are examples of the well-directed, capable "short"; but these are outstanding productions, and the greater number of failures tends to indicate that the most satisfactory of all subjects for beginners is the straightforward documentary. This is certainly able to afford full scope for sincere direction, besides offering a wholesome experience in motion-picture photography and providing excellent material for cutting and editing.

### The Scenario.

From this, there is no need to infer that it is advisable or even possible to dispense with a scenario. Amateur cinematography—whether of the "short" or "super" variety—is as much in need of this as is its commercial opposite; yet there is all the difference in the world between an amateur and a professional scenario.

Unfortunately, this point is not appreciated as frequently as it should be. Amateurs too easily accept the professional script as a model for their own requirements, whilst in some quarters the tendency to embrace such methods in their entirety is most marked. Instead of this, it will be found greatly to simplify the work of shooting if more attention be paid to *personal* requirements—where any methods (professional or otherwise) may be adapted to satisfy particular needs.

Obviously, a "plan" drawn up on these lines would be more suitable for the amateur one-reeler than any professional scenario could ever hope to be. Like the commercial scenario, this plan would require elaboration or "doping"; but again this should follow on suitable lines which will seldom approximate to those of the professional script.

### Shooting.

The important feature which amateur and professional scripts have in common is their need for arranging that scenes on the same set will—so far as is possible—be shot off before proceeding to those on another set. Thus, all the action planned to take place on a common set—quite irrespective of how the individual scenes will be cut up in the finished film—should be run off at the same time and place, for ultimate editing into "plan" order.

In the short-reel subject, of course, it is hardly possible to enjoy the full benefit of this method, and it is worth while considering how the admitted inconveniences of the method can here be avoided in favour of shooting strictly in the narrative order. At the same time, it must be realised that few films can be entirely finished in this way; though full scenes and often sequences can be filmed without any need for disturbing the order of shots as enumerated on the plan.

### An Example.

The following passage—culled from the novel plan of a new film by Arabella Hayne—shows how the more convenient method can be substituted for familiar procedure: "Track rear to M.S. of farmhouse kitchen. Farmer's wife, bland and plump. Cut to S.C.U. contented cat. Cut to S.C.U. farmer's wife sitting over her accounts. Pan slowly down to her feet, comfortable on hassock. Broad wipe to—"

The single idea which this passage so effectively conveys is at once apparent—though familiar methods of film enunciation would have led to complications in the shooting by introducing at least two widely-divergent cross-cuts. These, of course, may have given scope for plucky and brilliant editing; but it is worth noticing here that simplicity and clarity are better than doubtful pyrotechnics.

Especially when the fireworks fail to function.

The Hopping season is now in full swing, and a very attractive topical subject is available in the various hopfields for the amateur ciné worker.

# Improved Technique for "Reversal" Titling

By S. E. L. M.

**N**OW that more and more titles are being made by the direct reversal process, i.e., by simple shooting direct upon any kind of reversal stock, the familiar devices for obtaining bright, contrasty lettering must give way to newer and more suitable methods. Some of these are admittedly tricky and intriguing, whereas the real need of the amateur is for a sound, straightforward technique which may, however, be varied to suit the individual requirements of particular films.

Such a technique already exists in negative practice—where the familiar procedure is to expose upon a slow *positive* stock and then to increase contrasts by developing for the maximum of time in a paraphenylene-diamine or other fine-grain solution. This procedure is not, of course, applicable when dealing with reversal films—which demand, moreover, the use of a title card having white letters arranged upon a black ground.

Now, not only is it more difficult to prepare such titles, but it is found in practice that the shot titles are not so clear-cut or intense as those which are obtained when the lettering is black on a white card. Hence the first thing to do is to increase the efficiency of the title-card itself—so that subsequent technique will at least be spared the pains of trying to build up contrasts which are not there.

## The Title-card.

First, with regard to the question of colour, black is without doubt better than any of the fancy shades now obtainable—though efficiency again depends upon

the quality of the finish. Any surface that is smooth and shiny tends naturally to reflect more light than one finished in a dull matt; so that it is best always to use a card surfaced in either satin or matt-rough.

Then special attention must be paid to the lettering. This should generally be of the plain, "easy-to-read" variety—not scratchy, but well spaced and well proportioned. Spacing, of course, must vary with the quantity of lettering, but usually it should be so arranged that the latter forms a central block occupying not more than half the total area of the film frame.

Almost universally, white paint is recommended as the best composition for lettering; but whilst certain preparations especially intended for photographic purposes are quite good, greater efficiency has recently been obtained through the use of fine-quality aluminium paint. This can be secured (quite inexpensively) from any of the "six-penny" stores, together with a cleaning fluid—which is useful in reconditioning stencils, etc., immediately after they have been employed with aluminium paint.

## Shooting.

Satisfactory title-cards are useless if subsequent technique does not make for perfectly sharp images. Actually no method of shooting can give sharper titles than those which accrue from the use of a properly-adjusted title-board. Title-boards for use with the more popular types of camera are obtainable from the photographic stores, whilst several efficient substitutes for these

have been devised by amateurs themselves.

Where a title-board is not sharply focussing, the simplest way to check the cause is to expose just a frame or two of film on each of a series of titles marked, say, "30 in.," "27 in.," "20 in.," and so on—each "title" being shot at its declared distance from the lens. Necessary adjustments can then be made without delay.

Centring is another difficulty occasionally encountered in the use of title-boards. For absolute accuracy, it will be found best to carry out a further simple test on the lines of the above check. Here the "title" should consist of an ordinary crossword puzzle cut from the morning paper; the processed shot will clearly show what part of the crossword "pattern" has been covered by the lens, and particular adjustments can be accurately carried out after reference to this.

When actually shooting, the lens should always be stopped down to f/8 or thereabouts—the reason being that at this aperture there is sufficient depth of field to ensure absolute sharpness in the title images. In order to work at this aperture, however, the usual lighting may have to be increased; though in these days of the photo-electric meter there can be few of the old objections to shooting out of doors.

Finally, try to cultivate the habit of knowing what footage of any title will be required for actual use in the films you make. Reversal stock is not so super-abundant that any of us can afford to shoot lengthy titles three or four times over, especially since there is no prospect of their further use in any later film.

## A Competition specially for Novices

### SUBJECTS.

Prizes will be awarded for the best snapshots of family groups or single figures taken at home or on holiday, indoors or outdoors. The arrangement of the groups or the pose of the figures is left entirely to the discretion of the competitor.

The competition is open only to novices: those who have never won an award of any description in a photographic competition. Entries are restricted to contact prints. The smallness of the prints, which may be mounted if necessary, will not affect their careful consideration in this competition.

### PRIZES.

The prizes will consist of supplies of roll film or of plates (if any winner happens to use a plate camera).

THE FIRST PRIZE WILL BE TWO ROLL FILMS EVERY WEEK FOR ONE YEAR.

THE SECOND PRIZE WILL BE TWO ROLL FILMS EVERY WEEK FOR SIX MONTHS.

THE THIRD PRIZE WILL BE ONE ROLL FILM EVERY WEEK FOR SIX MONTHS.

TWELVE PRIZES OF ONE ROLL FILM EVERY WEEK FOR THREE MONTHS.

The winners of these prizes will thus be encouraged to continue their photographic activities throughout the year with a supply of free film.

### RULES.

Each print must have affixed firmly to the back, a coupon which will be found in our advertisement pages each week. This must contain title of print, and name and address of competitor.

The latest date for receiving entries is September 7th, 1935. This will still give readers of "The Amateur Photographer" sufficient time to collect and to enter their best prints taken during the summer months.

The decision of the Editor in all matters relating to this competition must be accepted as final.

All entries must be addressed as follows: The Editor, "The Amateur Photographer," Dorset House, Stamford Street, London, S.E.1, and the outside of the envelope or package must be clearly marked "Novices Competition."

# Letters to the Editor

*The Editor is not responsible for the opinions of his correspondents.*

## ECONOMY AND MINIATURE CAMERAS.

SIR,—The question of economy is one which is brought very much before the intending purchaser of a miniature camera, but it seems to me to be more of a theory than anything else.

Taking the spool of 36, the usual cost being 3s. 6d., as a general rule before one can exhaust the entire film it is a case of snapping at indifferent subjects so as to see the more important developed, or, as is agitated, one gets the film cut, which doubles the cost of developing if it is cut in two parts. Another difficulty is that when the film is cut, repeatedly I have had negatives scratched and showing on the prints, the D. & P. man maintaining that these scratches have been caused by the film being cut. This means a further loss, not only financially but the pictures that have been taken.

The miniature camera with the 36 negatives is one of the best for one who is travelling, though care must be taken to make certain of the speed of the film to prevent under or over exposures. If this is not judged correctly the entire spool is gone, whereas with a shorter spool the risk is not so costly, and one sees his results quicker and can adjust any defects in speed, etc.

It is a pity that the film manufacturers do not produce a 12-negative spool at a *pro rata* cost, and I hope to hear that such is being considered.—Yours, etc.,

"MINIATURE USER."

## USING THE "CORREX" TANK.

SIR,—Last year I spoilt my holiday films in a "Correx" tank, the main trouble being patches and streaks of uneven density across the film. Thanks to a suggestion of one of your correspondents, I have got over this; sliding the clip at the end of the apron back a little, so that the apron is not taut, made all the difference.

I still got airbells imprisoned beneath the top flange of the drum, which tapping the tank according to the instructions failed to dislodge. If, however, the drum is raised, say, 1/8th of an inch and jerked down on the bottom of the tank two or three times, any airbells are forced to the top of the developer. So now, as soon as the developer has been poured in through the lid, I remove the lid and "jump" the drum as mentioned, and never get an airbell along the top edge of the film. This is easily done in the dark, in the case of a panchromatic film, but the effect can be observed when the film is being washed.

One trouble still remains. On some films I get patches of greater density along the edges between the points where the film is touched by the corrugations. Apparently these are caused by fresh developer surging between the corrugations,

yet the tank must be revolved on its base occasionally to prevent the developer stagnating. If one of your readers has met with and overcome this difficulty I shall be grateful to hear how he succeeded, and his experience may interest other workers.

Wishing your paper continued success.—Yours, etc.,

A. L. SPENCE.

## TROUBLE WITH ROLL-HOLDER.

SIR,—I am using a roll-holder of the ordinary type, and am having a very great amount of trouble with focussing. The holder is a tight fit in the back of the camera, and is in apparently perfect order, and the camera front, if it varies at all, varies too little to make any important difference in focus, more particularly as I am using principally f/11 at present. Usually, bad results are found to be in focus at the sides, and out in the middle, or vice-versa, but sometimes the whole is completely out. On the other hand, when focussing for a near subject, the focus for that subject is almost invariably perfect.

Everything has been carefully checked, there is nothing loose, great care has been taken to focus at a uniform position on the scale for infinity, and camera-shake can be ruled out. I am wondering whether any of your readers have had any similar trouble and if they have succeeded in correcting it. My dealer, who is himself an expert, is quite mystified.—Yours, etc.,

S. G. J.

## "THE SHADOW ON THE SAND."

SIR,—I, too, noticed something false about this picture, and regarded it as a composite print. While uneven ground could explain the broken shadow of the arm, nothing but faking could make this shadow the darkest tone in the picture. Another thing that is unconvincing is the apparent impossibility of the model resting her hand on the rock, which appears to be several feet behind her.

I have no objection to composite pictures so long as they do not give themselves away, but few workers seem to be able to do the job properly. This suggests a novel competition for the best fake that cannot be detected as such. Press photographers being rigorously debarred from entering!—Yours, etc.,

H. H. GOODCHILD.

SIR,—In reply to Mr. Williamson's criticism, surely the "peculiar appearance" of the shadow to which he draws attention is due to the uneven surface of the sand? The shadow of the right arm is lost in a trough in the sand, and that of the left arm appears to be disconnected from the body shadow for a similar reason.

One would expect the model's shadow to be darker than the crevices in the rocks because the sand is a powerful reflector on everything above its level, but the rocks are poor reflectors for the shadow on the sand, apart from the fact that the rocks are themselves in shadow.

The photograph is a very satisfying one in every respect.—Yours, etc.,

"TYRO."

# Exhibitions and Competitions

## CURRENT AND FUTURE.

*Notices of forthcoming exhibitions and competitions will be included here every week if particulars are sent by the responsible organisers.*

*The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers.* Entries, September 30. Rules in the issue of August 28th.

California Pacific International Exhibition, San Diego.—May 29–November 11. Miss Ruth Kilbourne, Secretary Exhibition Headquarters, Balboa Park, San Diego, Cal., U.S.A.

Paris International Salon.—October 5–20. Secretary, M. E. Cousin, 51, Rue de Clichy, Paris.

Amsterdam International Salon.—September 14–29. Further particulars from Focus, Ltd., Fotosalon, Bloemendaal, Holland.

London Salon of Photography.—Entries, September 4; open, September 14–October 12. Further particulars from Secretary, London, Salon, 5a, Pall Mall East, S.W.1.

R.P.S. Annual Exhibition.—September 14–October 12. Further particulars from Secretary, 35, Russell Square, W.C.1.

Irish Salon (to be held at Mansion House, Dublin).—Entries, September 14; open, November 2–9. Particulars from Hon. Secretary, Irish Salon of Photography, 18, Morehampton Road, Dublin.

Rotherham P.S. International Exhibition.—Entry forms due, September 23; prints, September 30; open, October 16–19. Hon. Exhibition Secretary, E. George Alderman, Ruardean, Newton Street, Rotherham, Yorks.

Indian International Salon (promoted by Camera Pictorialists of Bombay).—Open, November 17–30. Hon. Salon Secretary, F. R. Ratnagar, Central Bank Building, Fort, Bombay, India.

G.W. Rly. "Camp Coach" Holiday Competition.—Prize, one week's holiday in camp coach during 1936 holiday season. Photographs should depict any aspect of camp coach holiday. Entries due, October 31. Further particulars from Superintendent of the Line, G.W.R., Paddington Station, W.2.

Canadian International Salon, National Gallery of Canada, Ottawa.—November 6–21, and afterwards in other Canadian cities. Entries due, September 20. Entry forms and further particulars from Exhibition Secretary, Canadian International Salon, National Gallery of Canada, Ottawa, Canada.

Cape of Good Hope International Salon (under the auspices of Cape Town P.S.).—Entries due, November 19; open, January, 1936. Hon. Salon Secretary, Richard Dekenah, P.O. Box 2431, Cape Town, South Africa.

Leicester P.S. International Exhibition.—Entries January 24, 1936; open, February 24–March 7, 1936. Exhibition Secretary, H. Foscutt, 19, Doncaster Road, Leicester.

The 40th Annual Exhibition of the South London P.S.—Open, February 15–March 14, 1936. Entries close, January 21. Further details and entry forms from Hon. Exhibition Secretary, H. S. Adams, 40, Stockwell Park Road, London, S.W.9.

# Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a *separate* stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for communications must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

## Photography in Church.

Can you inform me whether a Church of England clergyman has the power to prohibit photography inside his church, provided the photographs are taken from the nave and not from the chancel?  
G. C. (Bury.)

We are not sure of the legal aspect of the case, but we should certainly think that a clergyman could prohibit photography in the church of which he has charge. In our experience we have never known permission to be refused when it was properly asked for, and any clergyman who did refuse would probably have some good reason for so doing. In any case we should bow to his decision.

## Making Plates.

For a considerable time I have been experimenting with making my own plates, but I find that 5 seconds' exposure at f/8, in bright sunshine, is necessary to make any impression. How can I increase the sensitivity? And how can I prevent the emulsion coming off during development?  
E. C. (London.)

The matter of plate-making is not one to be dealt with by answering a few questions. It is a highly technical and complicated matter, and we should strongly advise you to give up any idea of making your own plates, as there is nothing that can possibly be gained by attempting to do so. The standard book on emulsion making and coating costs 21s., so that you can guess it is not a simple matter.

## Speed of Film.

I use a film which the makers state to be 600 H. & D. With my exposure meter I have to reckon the speed as 300 H. & D. to get good results. How can I calculate what speed to call it?  
W. A. R. (Edinburgh.)

If we understand your letter aright, we can only suggest that you regard the film as having a speed of 300 instead of 600. If you find that you get correct results in this way, there is really nothing to worry about, and no further calculations are needed.

## Ciné Film.

When a ciné film is reversed what is the reason if it is thin and grey? Is it over-exposure or under-development?  
F. A. W. (Colombo.)

If the finished film is too thin and grey, it means that the first development was overdone. If, on the other hand, it is too dense, the first development was not long enough. What you have to remember is that the final image is composed of silver that was left unaffected by the first development.

## Defect in Negatives.

What is the cause of the series of light dots on the enclosed negatives developed in a Kodak tank?  
H. W. L. (Grays.)

The trouble with your negatives is almost certainly due to the film being wound slack in the apron, so that the emulsion side was in contact with the small protuberances on the apron. As we have frequently pointed out, when winding the film into the apron you should keep a check on the free handle so as to keep the apron tight.

## Comparing Lens Apertures.

How much faster is an f/2 lens compared with a lens of f/4.5 aperture?  
C. L. (Tolworth.)

To compare all aperture or "stop" values one must square the f/ numbers and compare the results. In this instance the square of 2 is 4, and the square of 4.5 is approximately 20, so that f/2 is five times as fast as f/4.5.

## Water for Solutions.

Is there any objection to ordinary tap water being used for making up solutions?  
A. L. R. (Herne Hill.)

If the solution is not intended for immediate use then distilled or boiled water is to be preferred to water straight from the tap. Tap water generally contains air and lime, etc., which are mainly responsible for solutions deteriorating.

## Value of Stop.

I have a 5-cm. lens working at f/2.5. Believing that the stop number was the result of dividing the focal length by the diameter of the lens I was surprised to find my lens had a diameter of 16 mm. Is this correct?  
C. P. (Egremont.)

To find the value of a stop, you do not divide the focal length of the lens by the diameter of the lens, but by the diameter of the stop itself. This is only an approximation, and in the case of a combined lens will not give you the exact answer. In your case the diameter of the stop marked f/2.5 will be approximately 2 cm. (5 cm. ÷ 2.5). It will probably be a trifle less.

## Isochromatic.

Are isochromatic plates and films panchromatic or orthochromatic?  
J. P. A. (Godalming.)

Isochromatic is only another name for orthochromatic, and does not mean the same thing as panchromatic.

## Uneven Definition.

I have an old enlarger fitted with an f/4 lens, but it does not give sharp definition on the edges of big enlargements, but is quite all right for half-plate and smaller sizes. What is the cause—the lens, the condenser, or the lamp?

M. E. W. (Brighton.)

Undoubtedly the lens is the cause, since the lamp and condenser are responsible only for the evenness and intensity of illumination, and have nothing to do with definition. The lens is probably of the old "portrait" type, which was designed to give a large aperture to compensate for the slow plates in use twenty and more years ago. Its big drawback is that it has a curved "field," and this will explain why your enlargements are sharper in the middle than at the edges.

## Orthochromatic and Panchromatic Filters.

What is the difference between an orthochromatic filter and a panchromatic filter? Can I use a panchromatic filter with orthochromatic films?  
L. F. (Torquay.)

The difference between the two filters is that the first mentioned, generally a yellow colour, is intended for use with all orthochromatic (or isochromatic) films and plates, but can also be used with panchromatic material. The panchromatic filter, however, is intended for panchromatic films and plates, and, because it is generally a green colour, it is not satisfactory in use with orthochromatic materials.

## Cleaning Measures and Dishes.

What is the best cleaner to use for removing stain from porcelain dishes and glass measures?  
G. D. B. (Halifax.)

Pour a quantity of hydrochloric acid into an equal quantity of water and use this with a small dish mop. It can be used repeatedly until it becomes exhausted. If this is not strong enough, an alternative solvent can be made up as follows:

Water	..	..	20 oz.
Sulphuric acid	..	..	2 oz.
Potassium bichromate	..	..	2 oz.

This can also be used repeatedly until it is exhausted. Whichever solution is used be sure to wash the dishes, etc., thoroughly in plain water afterwards.

## WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

## CAMERAS AND LENSES

## AN IMPROVED ENLARGER FOR MINIATURE FILM

### THE DREMOMOGRAPH

is an entirely novel apparatus for enlarging from miniature film (Leica, Contax, Rytina, etc.) and 3 x 4 cm. (16 exp. on V.P. size film) negatives.

In view of the number of enlargers for amateur use placed on the market, up to now, there has been no departure from the system of projecting the light downwards on to a wooden table. The customary easel absorbs a large portion of the incident light, and the enlarged image is only faintly visible with dense negatives.

With the DREMOMOGRAPH the image is projected UPWARDS and can be examined comfortably, as on the focussing screen of a camera.

## THE DREMOMOGRAPH

Simplest possible manipulation. For 7 x 5 in., Postcard and 3½ x 2½ in. enlargements.

PRICE (without lens, for Leica or Contax 5-cm. focus lenses) £6:10:0

PRICE (with f/4.5 anastigmat lens in focussing mount) £8:10:0

40-watt Opal lamp, screw cap type, extra 2/6. (Please state voltage when ordering.)

**DREM PRODUCTS LTD.**

**The best Photo Corners!**

## "TRANSPAROL"

are made of pure "Cellophane" (Reg. Trade Mark), and not cheap imitation material. They are invisible, and show the picture up to its extreme edges. 6d. per box of 100.

*They do not stick together and ruin the snaps like those of inferior makes.*

## "FAVORIT"

are handsome opaque corners, easily and quickly fixed in position. Very ingenious—they make snapshot albums very beautiful—and eliminate the bugbear of messy paste pot and brush. Made in Sepia, Grey and Black. 6d. per box of 100.

# NOW IN STOCK

## ZEISS IKON SUPER IKONTA

The highest class distance meter coupled with lens roll-film camera that can be obtained. Zeiss Ikon precision work, Zeiss lenses, Compur shutters. For 16 pictures 2 1/2x3 1/2 on 2 1/2x3 1/2 spool, Zeiss Tessar f/3.5, Rapid Compur shutter £18 12 6 8 or 16 exposure, with Tessar f/4.5, Rapid Compur shutter £19 0 0 4 1/2x2 1/2, 8 or 16 exposure, with Tessar f/4.5, £19 15 0 The new Compur Rapid is supplied, except with 4 1/2x2 1/2, which has the Normal Compur shutter

## ZEISS IKON CONTAX

The miniature camera with a metal incompressible focal-plane shutter, providing exposures up to 1/1,000th sec. Long base distance meter coupled to and automatically focusing lenses. Choice of 12 Zeiss lenses, apertures f/1.5 to f/8. Die-cast body housing all working parts; open back, easy to clean and load in daylight. Takes any make of 24x36 mm. film.  
Price, with Zeiss Tessar f/3.5 £31 0 0  
" " Zeiss Tessar f/2.8 £33 15 0  
" " Zeiss Sonnar f/2 £41 0 0  
" " Zeiss Sonnar f/1.5 £56 5 0

## ZEISS IKON IKONTA

The camera which is "ready in a Hiffy," 100 per cent self-opening; 100 per cent good pictures. The 2 1/2x3 1/2 size takes 16 pictures on the usual 3 1/2x2 1/2 spool. The 3 1/2x2 1/2 and 4 1/2x2 1/2 sizes give either 8 exposures or 16 divided, and are fitted with the new Albada finder. 2 1/2x3 1/2, with Tessar f/3.5, normal Compur shutter £15 10 0 3 1/2x2 1/2 with Tessar f/4.5, Rapid Compur shutter £12 7 6 3 1/2x2 1/2 New Model, with Tessar f/3.8 and Compur up to 1/400th sec. £15 12 6 4 1/2x2 1/2 with Zeiss Tessar f/4.5 and Normal Compur shutter £13 0 0

## ZEISS IKON SUPER IKONTA

The latest 1935 Zeiss Ikon camera with Zeiss Ikon patent rotating wedge distance meter coupled to lens focussing permits the use of the ultra-rapid Zeiss Tessar f/2.8. Compur Rapid shutter (with delayed-action release) gives exposures up to 1/400th sec. Shutter and film-winding mechanism coupled together absolutely prevent inadvertent double exposures. Die-cast body of aluminium—exceptionally strong—hinged back, front self-erecting, shutter release situated conveniently on top of camera. Takes 11 pictures 2 1/2x2 1/2 on the usual 2 1/2x3 1/2 roll-film spool.  
Price, with Zeiss Tessar f/3.5 £25 5 0  
Price with Zeiss Tessar f/2.8 £28 5 0  
Complete list of Zeiss Ikon cameras post free.

# Optochrom Automat

## DAYLIGHT-LOADING ROLL-FILM DEVELOPING TANK

For  $2\frac{1}{2} \times 2\frac{1}{4}$  in.  
or  $2\frac{1}{2} \times 3\frac{1}{4}$  in.  
Roll Films.

PRICE

**35/-**

Packed complete  
with instructions  
for use.

Post Free.

The Optochrom Automat allows LOADING and development without any dark-room at home, in hotel, on board ship, in fact anywhere, and in BROAD DAYLIGHT.

It is well known that expert amateurs use developing tanks, because the whole developing process is carried on in complete darkness, of great importance when using panchromatic films.

The Optochrom Automat combines the advantages of the former developing tanks and at the same time solves the problem of inserting the film in daylight. The negatives are of a brilliance and clearness hitherto undreamt of.

CHEAP TO USE.—Developing costs only a trifle per film. No tedious waiting in the dark-room. Developing is now something you can do for yourself without any previous preparation.

Optochrom Thermometer (Fahrenheit).....2/6  
Optochrom Developing Powders, per 1-doz.....1/6  
Optochrom Fine-grain Developing Solution.....2/-

### A BARGAIN-BUYER WRITES!

London, W.1.

"I was completely astonished on unpacking, to see the condition of this 'second-hand' camera, and it is a proof of your honest dealing; many firms would doubtless sell it as a brand new job, and easily 'get away with it'."

C. A. M.

As advertisements on these covers go to press a fortnight in advance some of these second-hand items may be sold already, but similar outlays are usually available.

### FIRST EASY PAYMENT SECURES ANY CAMERA!

#### FOTH - DERBY

Takes 16 pictures on standard V.P. Roll Film. Very light and compact. Fitted with Foth f/3.5 or f/2.5 anastigmat and focal-plane shutter, giving instantaneous exposures from 1/25th to 1/500th sec., also time exposures. Delayed-action movement fitted to the shutter allows the operator to be included in the picture. Fitted with new type view-finder.

Foth f/3.5 lens. **£5:5:0**  
Foth f/2.5 lens. **£7:5:0**  
Nine monthly payments of 12/3 or 16/11.

#### SUPER IKONTA

Takes 11 exposures on 3½×2½ 8-exposure Roll Film. Double exposures impossible. Zeiss Ikon latest pattern rotating wedge distance meter coupled to lens focussing. Rapid Compur shutter. Modern die-cast body. Elegant construction. With f/3.5 Zeiss Tessar lens.

**£25:5:0**

Nine monthly payments of 59/-

#### FILMO 129 PROJECTOR

The latest addition to the Filmo range, gives a one-hour show without a stop. 750-watt lamp and highly efficient optical system give exceptionally brilliant illumination. Streamlined base and fore and aft reels. Every other conceivable refinement.

**£60:0:0**

Nine monthly payments of £7.

### PERFECT "AGAINST-THE-LIGHT" PICTURES with the

#### ZODEL LENS HOOD

(Patent applied for) allows you to take pictures almost directly into the sun. Combining portability with light weight and the greatest possible measure of protection. Telescopic and folds flat for carrying. Eliminates internal reflections from the camera bellows, and ensures brighter pictures. Adjustable screw fixing. In two sizes: "A," to suit lenses from 1 to 1¼ in. diameter; "B," for lenses from 1½ to 2 in. diameter, 7s. 6d. each. Filter Rings, 2s. 0d. each.

#### JUST RECEIVED

Sutton Coldfield.

August 11th, 1935.

"I received the Foth-Derby camera safely and am very pleased with it."

"I am writing chiefly to thank you for the very generous allowance you made for my old camera."

"Myself and my friends who have cameras are agreed that I made a good selection in dealing with you."

F. S. S.

### WHO WANTS 10 GUINEAS?

## ANTI-HALATION BACKING

The effectiveness of the anti-halation backing on 'Panatomic' Film will be seen from the following comparative tests. A thin line of intense light was photographed with progressively increasing exposures.

REGULAR FILM

'PANATOMIC'

The almost complete elimination of halation and scatter in the case of 'Panatomic' is strikingly evident.

Supercoat  
2 sensitive  
emulsions

Anti-Halation  
Backing

Showing the dark green dye which constitutes the anti-halation backing. It clears away during development.

# "MY ROLLEIFLEX WENT EVERYWHERE WITH ME"

June 5th, 1935.

Dear Sirs,

"I have just returned from a 16-day trip in Switzerland, of course my Rolleiflex went everywhere with me, Eismeer trips, Woods, The Jungfrauoch (12,000 feet up) with its brilliant, blazing sunshine and impossibly white snows, lakes, everywhere."

"The 120 exposures I made were all absolutely PERFECT . . . . ."

Yours faithfully,

Ernest J. Hughes.

# PHOTOGRAPHY MADE EASY

By **R. CHILD BAYLEY**  
Author of "The Complete Photographer,"  
"Hand Cameras," "Photographic  
Enlarging"

**AS EASY AS A · B · C**

This is a book for photographic beginners, and, if carefully studied, it will enable the novice with a camera to get a greater proportion of successful photographs than would usually be the case.

"Photography Made Easy" should be read by everyone taking up photography: it should form as much a part of the outfit as the camera itself: it is an ideal present to give an amateur photographer.

Crown 8vo, 250 pp. Stout paper covers

# THE "KALEE N.P.3"

## British Made 16-mm. Projector

"KALEE" in the professional Cinematograph (35 mm.) world is a name to conjure with. Millions of people are entertained weekly by pictures projected with the "Kalee" Projector. The instrument illustrated is equal in quality to the larger Projector, and is built with the same care and engineering skill. You are assured of perfect projection with the "KALEE N.P.3."

Sure and steady projection with brilliant illumination. Safety film trip and large single sprocket for feeding the film ensures no damaged films. Compensating "Framing" device—Motionless "Stills" can be shown at will—A certain and simple "Reverse"—Tilting action in base of Machine effected by single knob—Superlite Lens and Carrying Case.

IF YOU ARE INTERESTED !!! Send for a Copy of the  
**SOHO FILM MAGAZINE**

It contains a short list of films available for use in 16-mm. projectors. Additions will be made from time to time, of which all users will be advised. Write now and get your name on our list of users.

WEDNESDAY, SEPTEMBER 11TH, 1935.

Copyright—Registered as a Newspaper  
for transmission in the U.K.

VOL. LXXX. No. 2444.

THE Exhibition of Photography in Commerce and Industry, opened last week at the Princes Galleries, Piccadilly, is the first of the three big autumn photographic exhibitions held annually in London. Both the "Royal" and "Salon" open at the end of the present week, and, from all accounts, there is evidence that they will be well up to the standard of previous years, or even better. The entries in the Pictorial Section of the Salon, in particular, have exceeded all previous records, and the work has come from even farther afield. The same applies to the R.P.S., which, being more diverse in character, has a greater opportunity of attracting photographic productions from technical and scientific workers as well as pictorialists. For this reason the R.P.S. show will prove an interesting exhibition for those to whom the many different phases of modern photography appeal. The Salon is essentially an exhibition of the best pictorial work only, and it gives an opportunity of comparing pictures from all parts of the world. The P.P.A. show referred to above, at the Princes Gallery, is entirely devoted to the applications of the camera to commercial work.

Readers should note that, while the P.P.A. show is in Piccadilly, the R.P.S. is at 35, Russell Square, Bloomsbury, and the London Salon of Photography at the Galleries of the Royal Society of Painters in Water Colours, 5a, Pall Mall East, near Trafalgar Square.

### A Retrospective Exhibition.

Like all good ideas it is impracticable, of course, but a friend at the advent of this exhibition season expressed a wish that once, say, every seven years, the shows in

## TOPICS of the Week

### A Weather Forecast FOR THE WEEK

By D. K. BARTLETT.

#### THURSDAY, SEPTEMBER 12th.

There will be fair and bright periods during the day, after early cloudy and showery weather, mostly in the South to Eastern Districts and parts of the North.

#### FRIDAY, SEPTEMBER 13th.

The weather will continue very similar till during the afternoon, when a misty or slightly overcast atmosphere will gradually occur in the Eastern Counties, with a thundery tendency in the West of Great Britain.

#### SATURDAY, SEPTEMBER 14th.

A changeable and breezy day, with unsettled periods, particularly over the Eastern Counties and spreading from Ireland to the North, leaving the South-West to some extent fairly bright and fair.

#### SUNDAY, SEPTEMBER 15th.

A good deal of breeze and cloud with occasional showers in the Western Counties, with considerable amounts of fair weather generally.

#### MONDAY, SEPTEMBER 16th.

Some bright and sunny periods should occur with less disturbing weather in parts, except off the East Coasts, the atmosphere becoming clearer towards the afternoon and evening, after a somewhat dull morning.

#### TUESDAY, SEPTEMBER 17th.

Fair in the East and Southern areas of Great Britain, with cloud and showers in the South-West and Wales, spreading Northwards.

#### WEDNESDAY, SEPTEMBER 18th.

The South-East of England should remain fairly settled, but very disturbed weather will gradually take place, increasing in the Western districts of England, Wales, across to Ireland.

Pall Mall East and Russell Square would decline all new work, and lie fallow, showing a selection of examples from past exhibitions. To see some of the old works again would be a great joy. It might make us proud of our recent progress or it might, on the contrary, depress us by showing up our declension. Anyhow, it would be instructive, and to many pleasurable. By the way, what is the eventual fate of all the pictures shown in bygone years? Some of them go into permanent collections, but what about the others? Where do these files go in their winter-time?

### "Iso" and "Ortho": an Explanation.

In a recent reply to a correspondent (page 240) it was explained that "Isochromatic" is only another name for orthochromatic," and this reply has brought from an old reader a letter in which he states that he was one of the first users of the Ilford Isochromatic plate when it was introduced on December 1st, 1891, and although forty-four years have passed he well remembers how the rival names, iso and ortho, were argued by the pundits. Professor H. W. Vogel is said to have invented these colour-sensitive plates in 1873, but they were not a commercial product until many years later. Vogel prepared them when employed by the Prussian government to make photographs of an eclipse of the sun, he colouring the collodion emulsion in order to secure a perfect image of the corona. Vogel seems to have been at a loss to find a name for the new plates, but another expert, Dr. Eder, said the plates should be called "orthochromatic," from the Greek "orthos," meaning "correctness," i.e.,

correct colour rendering in monochrome. A rival scientist, Becquerel, who one year later (1874) made similar plates, called them "isochromatic," which really means equal in colour, from the Greek word "isos," equal. No general agreement was come to, hence the two names which often puzzle so many amateurs. Another Continental authority, anxious to find a better name for the plates, and perhaps appease the rivals, advocated "orthoskiagraphic," but this did not find favour.

### Sunburn and the Nude.

After spending some time on a stretch of the south coast it has been a real relief to return and find people in clothes. This spectacle of nudity, while not shocking at all, can become very wearisome, and when the too abundant flesh suggests by its coloration that it is being fried in a pan it becomes repulsive. Not for nothing are human beings, as a general rule, seen in dress. The human being gains

dignity and expressiveness by being attired. No doubt the nude has its place both in society and on the walls of photographic exhibitions, but one is quickly surfeited and the chief value of the nude is as a foil to the dressed.

### Times Have Changed.

Forty-eight years ago this September the late E. J. Wall commenced answering questions put by readers of *The Amateur Photographer*, a work he carried on for several years, and a very busy time he had, as photography was then more difficult than it is to-day. Dry plates and stand or field cameras were in common use. There were no daylight-loading roll films or compact hand cameras, and amateurs did their own developing and printing. After a year's experience of amateurs' failures—then more common than they are to-day—Mr. Wall made some investigations and came to the conclusion that in the majority of cases an amateur's first hundred exposures

resulted as follows: Good negatives, 12; passable, needed intensifying or other treatment, 25; fogged, either in camera or dark-room, 20; over-exposed, 30; under-exposed, 10; unclassified, 3. One would like further details of this analysis (found in some of Mr. Wall's manuscript notes) but they do not exist. The comparatively large number of over-exposures, and the fewness of under-exposures, were probably due to the fact that most of the exposures were then made with a cap, not with a shutter. A present-day authority who develops thousands of roll films says that of every one hundred failures (not exposures) 30 are due to under-exposure, 12 to over-exposure, 16 to movement of camera during exposure, 7 to incorrect focussing, 10 to films not exposed, and 5 to double exposures. The percentage of good results, which nowadays must be very high because of the excellence of materials, is not known; many D. and P. firms say that as many as 90 per cent of exposures are printable.

## READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with on this page week by week. Other replies appear as usual on the last page.

### Ozotype.

*Can you give me an idea of the invention and character of the Ozotype printing process, so as to make it clear how it differs from Carbro?*  
P. M. (Newcastle.)

It was Thomas Manly who suggested the Ozotype process, about 1899, as a variation of the familiar and popular carbon process. A piece of single-transfer paper, as used in carbon work, was sensitised with a solution of potassium bichromate. In the original instructions some manganese sulphate was added to the solution, but this seemed to serve no purpose and was omitted.

The sensitised transfer paper was dried in the dark, and then exposed under a negative to daylight until all details were visible. A piece of carbon tissue was then immersed for about one minute in a sensitiser which took different forms, but a typical one was:

Glacial acetic acid .. .. .	1 dr.
Hydroquinone .. .. .	9 grs.
Water .. .. .	20 oz.

At the end of the minute the printed transfer paper was slipped into the bath, brought quickly into contact with the tissue, drained, and put between blotting-papers till dry. Shifting of the two surfaces in contact had to be avoided, or a double image might be formed.

The two papers, adhering together, were soaked in cold water for half an hour, and then the procedure was identical with that of carbon printing.

The action of light on the sensitised transfer paper converted some of the bichromate into chromium chromate, from which the acetic acid liberated chromic acid. This in turn reacted with the hydroquinone, and some of the gelatine of the tissue became more or less insoluble, and adhered to the paper.

About 1906 Manly modified the process into that which he

called Ozobrome, in which a bromide print was substituted for the printed-out transfer paper. This process was further modified and improved till it evolved into the Carbro process. One of the outstanding advantages of this is that enlarged prints can be used, thus doing away with the necessity of enlarged negatives for contact printing.

### Copper Toning.

*Will you please furnish me with a really reliable formula for toning bromide prints with copper? I have experimented with one solution, but am not satisfied with the colour of the prints.*  
F. E. L. (Blackburn.)

We do not know the kind of colour at which you are aiming, but the formula we give is, like many other toning solutions, progressive in its action. The original black of the bromide image will gradually become warmer, so that you have available a range from warm black to purple-red according to the time of immersion. The image is not intensified; indeed there may be slight reduction, so that the original print should be on the strong side.

The solution we recommend is that devised by W. B. Ferguson, namely:

Neutral potassium citrate .. .. .	350 grs.
Copper sulphate, 10 per cent solution .. .. .	5 1/2 drs.
Pot. ferricyanide, 10 per cent solution .. .. .	4 1/2 drs.
Water to .. .. .	20 oz.

The solution is a clear light green, and the quantity given will tone about eight whole-plate prints, or their equivalent.

When the desired tone is reached the prints should be well rinsed, and then fixed in a plain 5 per cent solution of hypo. A thorough washing completes the process. The final colour can be judged only when the prints are dry, and this will be a future guide as to the stage at which to stop the toning process.

# The Exhibition Season Opens

The two leading exhibitions of pictorial photography, The London Salon and The Royal Photographic Society, both opening on Saturday next, the 14th, mark the opening of the Exhibition season for the amateur, and should be visited by all keen workers. The following article shows how the visitor can profit and derive instruction from studying the work on view at these and all other photographic exhibitions.

WITH the coming of the shorter days the season of photographic exhibitions opens. Almost every photographic society, large or small, has an annual exhibition of members' work, while the larger organisations have open classes which are supported by photographers of international repute. The value of entering his work in competition with that of other photographers is looked upon as one of the best incentives to progress, but even if his own work does not appear upon the walls no keen photographer would resist the opportunity to visit a photographic exhibition. The non-exhibitor can profit from a study of the work on view, especially if it is examined in a careful manner.

## **The Value of Competition.**

The production of work intended for exhibition is a stimulating effort for any photographer. There is the incentive to produce the very best work, and also it must be finished by an appointed time. The best test of the work of any photographer is to see it side by side with that of others. It will often happen that a print which appears satisfactory when viewed alone, when seen with others upon an exhibition wall loses much of its quality.

The high standard set by the selecting committees of the larger shows, whereby acceptance or rejection of the work is a test of its success is well realised, and in the smaller shows where everything sent in is hung, the photographer has the advantage of being able to compare his best prints with those of others of similar standing.

## **The Non-exhibitor.**

Although the greatest benefit is gained by those who participate in the show, those who are not exhibitors can secure a vast amount

of useful knowledge. It must be admitted that in very many cases a visit to an exhibition is of less benefit to the individual than it might be, and it is with regard to these that the present article is mainly addressed.

The work at any of the high-class exhibitions may be divided into two classes. There is the conventional work of those photographers who follow the older, well-defined lines, and, in contrast, there are to be seen prints which have the merit of originality and aim at personal expression. The "modern" photography comes under this heading, and this should be given some study, remote from personal preferences.

There are at every exhibition prints which do not appeal at the first glance, but these should not be dismissed too casually. Prints which have the merit of originality will often indicate to those who study them fresh subjects, or new conceptions of old themes. The original treatment of an old subject should have special consideration, although at first the result may not be regarded as successful.

In this connection there is one point that should be impressed upon the photographer visiting an exhibition, and especially the beginner. There is the tendency to copy or imitate successful work, and such efforts will necessarily fail in their objective. In order to be successful any work of art must have the merit of originality, either with regard to the subject, its treatment, or both. Subjects which are original are hard to find, but any modern exhibition furnishes many examples of original treatment of subjects which are in themselves hackneyed.

## **The Technical Side.**

In the majority of cases most of the exhibits, with the exception of those in the technical section, are

dependent upon their artistic appeal. At the same time these pictures will be found to display fine technique. Pictorial photography has been described as a combination of science and art. The technical side must be given full consideration in order to carry out the idea.

## **Study the Technique.**

From a study of the best work upon technical grounds the observant photographer can learn much. He will see the results of proper exposure, of negatives developed to meet the needs of the particular subject, and the printing process employed. The effect of control may or may not be evident. The prints will have full tone, and be of good colour, and it may be well to compare them, in a stern spirit of self-criticism, with the work that the photographer has himself produced in the same medium. How, for example, do our bromides compare with the bromides on the walls of the exhibition? If a visit to an exhibition produces dissatisfaction, it may be well worth while. It may demonstrate what results the process is capable of producing.

Most exhibition prints are in these days made upon bromide and chloro-bromide papers, but there are other processes represented. The photographer can compare the results obtained with other processes. Carbon, Carbro, platinum, gum-bichromate, are all represented, and the photographer who takes the trouble to study the effects to be obtained with these processes, as indicated in the catalogue, will find much to profit by.

If a visit to a photographic exhibition does nothing more than arouse personal dissatisfaction with the photographer's own efforts, and an incentive to do better, the time will be profitably spent.

# "Out of the ordinary" *Subjects for Late Seaside Holidays*

By H. RUSSELL THOMPSON.

**A**LTHOUGH for many amateur photographers the summer holiday by the sea is already a thing of the past, there are many readers who, for various reasons, are taking their vacation during September. In many ways this is an ideal month at the seaside; the crowds have vanished, and while bathing belles, surf-riders, paddlers of both sexes and of all ages, and children having donkey rides, etc., are still in evidence, they do not occur in such large numbers. For this reason much greater opportunities are offered for picture-making of a less usual and hackneyed type of subject.

In September, as at any other time of the year, the photographer at the seaside must remember that open beach scenes need short exposures because of the amount of light reflected from the sea, and on bright days, if a modern fast film is used, the lens must be stopped down considerably to avoid over-exposure.

Later in the day, however, panchromatic films have a greater

*The Deserted Cliffs.*

*Overhauling the Lifeboat.*

chance of demonstrating their capabilities. The late afternoon light is definitely more yellow in character than during high summer, and this, coupled with the low lighting, will be productive of many attractive snapshot subjects with long shadows that would not be possible at any other time.

If there is a harbour, many fine pictures can now be secured round the quay, particularly if it is a fishing-port. Unloading boats, drying nets and mending sails will provide plenty of unusual material, and there will always be the gulls to provide subjects for a quick shutter. Here again the rapid pan, film will score.

In such a locality—near the harbour—there are generally whitewashed cottages in narrow streets, at the doors of which may be "old salts" who will be found mending their nets or lobster pots while spinning yarns with their mates. Others may be boat-building or painting, or just lolling against the wall smoking and passing the time of

day. These are incidents and subjects peculiar to the end of the season, and will afford many fine pictures for the amateur.

Apart from the usual beach scenes that may still be available, and which should be treated differently if possible from the summer snapshot, there are walks in the neighbourhood of the shore, and cliff scenery, etc. Views of the coastal scenery from the cliffs should in any case be taken from as high a viewpoint as possible.

*The End of the Season.*

## S P E E D

The metal focal-plane shutter on the Contax is speeded to 1/1,000th second. There is no fiction about the high speed on the Contax. It is an actual 1/1,000th second, and is sufficiently rapid to take the fastest moving objects such as racing motor cars, horses jumping, etc. The slow speeds on the Contax down to 1/2 second are also very useful. They work smoothly without the slightest trace of vibration.

SHUTTER SPEEDS UP TO A REAL 1/1000 SECOND

## ACCURACY

The mechanical and optical accuracy of the Contax are worked to the finest possible limits. For example, the setting of the focal plane is worked to an accuracy of 1/1,000th in. The resting surface for the lens is also dead accurate, and the bayonet catch system adopted obviates the uncertainty of the effect of wear upon screw threads.

NEEDLE-SHARPNESS EVEN IN CORNERS

## VERSATILITY

The optical versatility of the Contax is unique. There are twelve Zeiss lenses varying in focal lengths from 1 1/2 in. to 20 in. These lenses are designed to cover all branches of photography, including wide-angle work, street scenes by normal artificial light, theatre photography, in addition to the more usual daylight subjects, landscapes, street scenes and sports pictures. The most rapid lens is the Sonnar f/1.5. The extreme wide-angle and telephoto lenses work at f/8. The wide-angle Biotar has the phenomenal working aperture of f/2.

12 CONTAX LENSES

The aim in designing the Contax has been to construct the best miniature camera of the present day. The Contax produces miniature negatives of exquisite quality and definition which will enlarge up to at least 40x the original. The wide range of Zeiss lenses, the Contax metal focal-plane shutter, the removable back, making the interior of the instrument accessible for cleaning, the wonderful accuracy of the Zeiss Ikon patent rotating wedge distance meter, place the Contax in a class by itself.

Z E I S S I K O N

# CONTAX

The whole story of Contax photography is told in our books "The Connoisseur and the Contax" and "The Ten Contax Lenses," both of which will be sent free on application.

The Zeiss Ikon panchromatic Pernox film 26° Scheiner 16/10° DIN is now spooled for Contax. 36 exposures 3s. 6d.

**The VICTORIA (Improved Model)**  
The ideal camera for Autumn photography.

F/2.9 Schneider Rad-dionar anastigmat, delayed-action Compur shutter, speeds 1 to 1/250th sec., T. and B. .... **£6:15:0**

Nine monthly payments of 15/9.

16 pictures  
2 1/2 x 1 1/2 on  
standard 2 1/2  
x 3 1/2 Roll  
Film.

Body of camera is moulded from practically indestructible plastic material, the surface being attractively finished. Leather bellows are fitted and the metal parts of camera are plated. The camera front is automatically erected into position for infinity photographs when the opening button is depressed, and the same movement opens up the optical direct finder on the side of camera. Focussing adjustment for near views is provided by rotating the front lens mount according to the scale engraved on the mount.  
Soft leather purse, zip fastener..... 5s. 6d.  
Leather case, velvet-lined, lock and key..... 6s. 0d.

**THE NEW SUPER IKONTA**

Takes 11 pictures 2 1/2 x 2 1/2 on standard 3 1/2 x 2 1/2 roll films. Body of hard aluminium alloy, with hinged back, leather covered, leather bellows. Weighs only 19 oz.

Special device to avoid double exposures, latest pattern distance meter coupled to lens focussing, f/3.5 Zeiss Tessar anastigmat, Rapid Compur shutter, speeds 1 to 1/400th sec., T. .... **£25:5:0**

Nine monthly payments of 58/11.

**"AGFA SPEEDEX"  
IMPROVED MODEL.**

**TAKES STANDARD  
V.P. ROLL FILMS**

Fitted f/3.9 Solinar anastigmat, in Compur shutter, speeds 1 to 1/300th sec., T. and B., self-erecting front, optical direct-vision finder..... **£5:5:0**

Nine monthly payments of 12/3.  
3 1/2 x 2 1/4, f/4.5 Agfa Solinar anastigmat, delayed-action Compur shutter, speeds 1 to 1/250th sec., T. and B. .... **£7:7:0**

Nine monthly payments of 17/2.

**The  
Multi-speed  
EXAKTA**

Self-capping focal-plane shutter, speeds 12 to 1/1,000th sec., T. and B., delayed action 1/10th to 6 sec.

Fitted f/2.8 Zeiss Tessar anastigmat, metal focussing hood, with magnifier, simple focussing, 3 ft. to infinity. Takes standard V.P. films. .... **£27:10:0**  
Double exposures an impossibility.  
Nine monthly payments of 64/2.

# Water-Bath Development

By H. A. SUMMERS.

**A**LTHOUGH much has been written about the use of the water bath in developing negatives, it is doubtful whether the larger body of amateurs yet realise the big advantages to be gained by this practice.

In case some readers are not familiar with the procedure—briefly it is to break the ordinary time of development into three stages. After developing in the ordinary way for 30 seconds, the plate or film is taken out of developer and placed into a dish of plain water for two minutes (without rocking), taken out, re-immersed in the same developer for 60 seconds, and then back again for another two minutes in another dish of clean water. This procedure is repeated for the third stage, when the plate is left in the developer for 90 seconds, and subsequently another two minutes in water.

It will now be easily seen that the plate gets 3 minutes in the developer and 6 minutes in water (when the shadow detail continues to go on developing) so that the "high-lights" have only one-third of the time to go "racing away" from the shadows. It must be pointed out at once that the ratio of 30, 60 and 90 is more or less optional.

No. 2. Norman Doorway, Malmesbury.

No. 1. Savernake Forest.

The writer, who has experimented for some time with this method, has found that this is an excellent basis to work on. It can be varied in length of development; for instance Savernake Forest (No. 1) was only given two stages of 40 seconds and 80 seconds, respectively, in the developer, and although the negative is a little on the thin side, the result speaks for itself when one remembers the extreme contrast of this class of subject when the sun is shining brilliantly.

So many workers vary in the ultimate type of negative they desire, that it is difficult to lay down a hard and fast ratio, but it would be very inadvisable to give less than 30 seconds for the first immersion—and, of course, all this is based on the assumption of a full exposure for shadows.

It may be supposed that this practice is only necessary in extreme cases of contrast—sunsets or night scenes, for instance—and while it is, of necessity, then, it is also a great help in more ordinary subjects of less contrast.

In the case of the Norman Doorway, Malmesbury (No. 2), when the sunshine was most brilliant, compare the detail in the inner doorway with that of the sunlit exterior—and I think it will be agreed the result is almost as the eye saw it.

Although it would be quite wrong to suggest that all subjects require this treatment, it is surprising to find how the number of exposures, made with the intention of using this method, increase.

The reason for this of course is, that one succumbs far more readily to those attractive "against-the-light" pictures when armed with the knowledge that they can be easily and surely controlled in development.

The negatives from which the illustrations were made were on S.G. panchromatic plates, backed.

# Skyscape

The use of a slip-on yellow filter, now universally stocked by all good firms, is simplicity itself to any one who has used a camera for even a few weeks. It must be realised at the outset that the combination of yellow filter and panchromatic emulsion are essential to good cloud photography, and that the sooner a trial roll of pan. film, or a batch of pan. plates is exposed through a K 2 or equivalent filter, on a

*Left: Dramatic Cumulus Nimbus. 1/25th, f/11, K2 filter, "Spectrum" plate.*

*Below: Sunset with Alto-cumulus and Cirrus clouds. 1/50th, f/8, K2 filter, Superpan film.*

**E**VEN in these days of panchromatic emulsions and filters we frequently hear or read remarks expressing surprise, admiration or approbation at some picture in which clouds are rendered, and not infrequently is the question put: "How can I get nice clouds and skies in my snaps?"

Actually, there need be no difficulty, since it is really very easy to obtain cloud pictures. Of course, cloud pictures can be made without the use of a filter by using one of the "ortho" or "self-screen" type of emulsions, but they are mainly useful, in a rather limited way, for making pictures of sunsets or of such skies in which there is not much blue and white.

Even here, however, a much improved rendering will be obtained if the panchromatic emulsion and yellow filter are used.

Colour, which always tends to be a snare to the photographer, can rarely play more disconcerting tricks than in the portrayal of skies; and the first thing that the would-be cloud photographer must become really familiar with is the effect of colour on the sensitive emulsions from which he can, nowadays, choose. Especially is this the case in regard to blue, which tends to have nearly the same effect as white.

The subject of correct colour rendering in photography is one which needs dealing with by itself, and it may be mentioned here that the publications by Ilford and Kodak on this subject should be in the possession of everyone interested in photography on account of their interest and value.

There is nothing difficult to be mastered here, neither is there anything difficult, nowadays, in the purchase and development of excellent panchromatic material; for, should the photographer hesitate to do the development himself, his local firm will make an excellent job of it for him.

good, strong, blue-and-white sky, the sooner will the aspiring photographer not only put the foregoing remarks to the test, but will also gather in the first-fruits of the abundant harvest of interest and enjoyment awaiting him.

# Photography for ALL

By E. G. WILLIAMS.

He will find that there is a great amount of enjoyment to be obtained by studying and photographing clouds from the point of view of weather alone, and a carefully-kept album of cloud pictures with weather details appended will afford unending interest to one's friends as well as to oneself.

Since, however, cloud pictures usually lack human interest, they are not, as a rule, sought after for themselves alone, but rather for their value as an adjunct to picture-making. Although it is an excellent plan to get sky and subject at one shot, this is not always possible; hence the necessity of a good and varied stock of cloud negatives for putting in the skies in composite pictures.

A word of warning is necessary here, for, when using well-defined skylscapes, it is of the greatest importance to see

*At Loch Shiel. 1/25th, f/11, no filter, Verichrome film.*

*At Windermere. 1/50th, f/11, K2 filter, Superpan film.*

Finally, be sure to tell your local firm that your material for development is panchromatic; and also ask specially for your negatives to be printed for clouds. If you do your own developing and printing you will be able to get the special effects you desire, save money, and obtain the real and lasting interest which photography can give.

that the picture and its cloud background have the same angle of lighting, and that their respective weather conditions correspond fairly well.

The examples which illustrate these remarks are all "one shot" pictures, and full details are appended to serve as a guide to those who are unfamiliar with exposures of this type. Any make of camera, provided that its lens is accessible to fit a slip-on filter, can be used, from box cameras to the more expensive reflex or miniature models. Success depends more on the choice and correct use of filter and emulsion, since even winter skies can be given 1/65th sec. at f/11 (without filter) or 1/25th sec. at f/11 with K2 filter on super-sensitive pan. film.

*Cumulus and Cirrus. 1/25th, f/11, K2 filter, Superpan film.*

# News and Reviews

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS

**Correction.**—A printer's error appeared in the article entitled "Intensifying Negatives by the Physical Method," in last week's issue of "The A.P." In the instructions for making the working bath it said, "dissolve 10 oz. of metol in 1 oz. of a solution." This obviously should have been 10 grains of metol. We thank the numerous readers who promptly drew attention to the error.

**Keen workers** who would like to further their photographic knowledge will be interested in the Borough Polytechnic's classes on Mondays and Fridays. Practical and theoretical instruction is given in all branches by Mr. R. Coombs, who is also conducting a class at both the Dalston Literary Institute and N. Southwark Men's Institute.

**The exhibition of Leica photography** which proved so attractive early in the year in London is being shown again in Birmingham, and is on view at 236, Broad Street. The exhibition will remain open until October 5th, and is open daily from 10 a.m. to 9 p.m. Admission and illustrated catalogue free.

**R.P.S. Exhibition Lectures.**—During the course of the Annual Exhibition of the Royal Photographic Society, at 35, Russell Square, W.C., the following evening lectures will be given at seven o'clock on the dates mentioned: Tuesday, September 17th, "Photography, Past and Present," by J. Dudley Johnston; Friday, September 20th, "Round about Durham," by Robert Chalmers; Tuesday, September 24th, "4,500 Visits to the Zoo," by J. E. Saunders; Friday, September 27th, Exhibition Lantern Slide Night. The slides selected for the Exhibition will be projected on the screen; Tuesday,

October 1st, "Vesuvius, Pompeii and Herculaneum," by E. A. Robins; Friday, October 4th, "Cannibals and Dragonland," by Arthur Pereira; Tuesday, October 8th, "The Glories of the Peak District," by E. C. Rutherford; Friday, October 11th, "How it Works in Photography"—Colour Photography," by D. A. Spencer.

Seats can be reserved in advance at a charge of 6d. All seats so reserved must be occupied by 6.55 p.m., when all unoccupied seats will be filled.

**Lost.**—On August 27th, between East and West Wittering, on one of the groins on the sands a reader of this paper, Mr. A. J. M. Jones, left a de luxe model of the Pathé motocamera, with telephoto attachment. The number of the camera is V.47886, and the lens No. 240163. The loss of the camera was discovered within an hour or so, and notices in the local shops offering an award have already appeared. Anyone being able to trace this camera should communicate with Mr. Jones, at Overseas League, Vernon House, Park Place, St. James's Street, London, S.W.1.

**The current issue of the *Art Trade Journal*** contains a number of articles that will appeal to many of our readers. It deals with "better framing," and is intended to assist those who wish to frame pictures for interior decoration. The number is well illustrated, and the information is attractively presented. A copy can be obtained from any newsagent.

**An Evening Class** for instruction in photography, at the Cripplelegate Institute, Golden Lane, City, E.C.1, under the direction of Mr. John H. Gear, will recommence on the 2nd October next. This class has been running without a

break for over thirty years and appears to be still very popular. During the past three or four sessions the limit in numbers of students has been reached before the start of the class. Intending students should therefore apply at once for a detailed syllabus, addressing the Manager of the Institute. Subjects dealt with cover a wide field in technical, commercial and pictorial work, in addition to the increasing, popular section of Miniature Cameras and enlargements of great amplification.

**The Central London Group of the Kodak Fellowship** have arranged an interesting and extensive programme for the winter, beginning with two coach outings on the 15th and 29th of this month. The first is a visit to the Kent hopfields, and the second to Wendover and the Chiltern Hills. Full particulars from Mr. W. A. Large, 401, New Cross Road, London, S.E.14.

**Readers in the Harrow district** are cordially welcomed to the Harrow Camera Club, which begins this session on September 17th next with an attractive programme. Full particulars from Mr. E. G. Barber, 40, Butler Avenue, Harrow.

**Messrs. Johnson & Sons**, of Hendon Way, Hendon, London, N.W.4, are again prepared to send data and material for the following interesting and instructive demonstrations: "Correct Development by the Azol Method," "Flashlight Photography," "After-treatment of the Negative," "Toning of Gaslight Prints," "How to do your own Developing and Printing." If any secretary of a photographic society or camera club can get a member to give any of these the firm will be pleased to receive their applications at the above address.

## Exhibitions and Competitions

### CURRENT AND FUTURE.

Notices of forthcoming exhibitions and competitions will be included here every week if particulars are sent by the responsible organisers.

**The Amateur Photographer Monthly Competitions** for Beginners, Intermediate and Advanced Workers. Entries, September 30. Rules in the issue of August 28.

**California Pacific International Exhibition**, San Diego.—May 29–November 11. Miss Ruth Kilbourne, Secretary, Exhibition Headquarters, Balboa Park, San Diego, Cal., U.S.A.

**Paris International Salon.**—October 5–20. Secretary, M. E. Cousin, 51, Rue de Clichy, Paris.

**Amsterdam International Salon.**—September 14–29. Further particulars from Focus, Ltd., Fotosalon, Bloemendaal, Holland.

**London Salon of Photography.**—Entries, September 4; open, September 14–October 12. Further particulars from Secretary, London Salon, 5a, Pall Mall East, S.W.1.

**R.P.S. Annual Exhibition.**—September 14–October 12. Further particulars from Secretary, 35, Russell Square, W.C.1.

**Irish Salon** (to be held at Mansion House, Dublin).—Entries, September 14; open, November 2–9. Particulars from Hon. Secretary, Irish Salon of Photography, 18, Morehampton Road, Dublin.

**Rotherham P.S. International Exhibition.**—Entry

forms due, September 23; prints, September 30; open, October 16–19. Hon. Exhibition Secretary, E. George Alderman, Ruardean, Newton Street, Rotherham, Yorks.

**Indian International Salon** (promoted by Camera Pictorialists of Bombay).—Open, November 17–30. Hon. Salon Secretary, F. R. Ratnagar, Central Bank Building, Fort, Bombay, India.

**G.W. Rly. "Camp Coach" Holiday Competition.**—Prize, one week's holiday in camp coach during 1936 holiday season. Photographs should depict any aspect of camp coach holiday. Entries due, October 31. Further particulars from Superintendent of the Line, G.W.R., Paddington Station, W.2.

**Canadian International Salon**, National Gallery of Canada, Ottawa.—November 6–21, and afterwards in other Canadian cities. Entries due, September 20. Entry forms and further particulars from Exhibition Secretary, Canadian International Salon, National Gallery of Canada, Ottawa, Canada.

**Seventh Western International Photographic Salon.**—November 23–30. Entries close, Monday, October 28. Particulars and entry forms from the Organising Secretary, W. H. Hill-Muchamore, 24, Church Road, Redfield, Bristol, 5.

**Cape of Good Hope International Salon** (under the

auspices of Cape Town P.S.).—Entries due, November 10; open, January, 1936. Hon. Salon Secretary, Richard Dekenah, P.O. Box 2431, Cape Town, South Africa.

**IXe International Kertsalon Fotografische Kring "Iris."**—Open, December 22–January 5, 1936. Entries close, November 15. Particulars and entry forms from J. Van Dyck, Secretary, "Iris," 69, Ballaerstraat, Antwerp.

**Leicester P.S. International Exhibition.**—Entries, January 24, 1936; open, February 24–March 7, 1936. Exhibition Secretary, H. Foscutt, 19, Doncaster Road, Leicester.

**Scottish National Salon.**—February 8–29, 1936. Entries close, January 11th. Particulars and entry forms from the Hon. Salon Secretary, Norman G. Brown, 36, North Lindsay Street, Dundee.

**The 40th Annual Exhibition of the South London P.S.**—Open, February 15–March 14, 1936. Entries close, January 21. Further details and entry forms from Hon. Exhibition Secretary, H. S. Adams, 40, Stockwell Park Road, London, S.W.9.

**Darwen Exhibition of Photography.**—April 20–May 2, 1936. Entries close, March 19. Particulars and entry forms from the Secretary, J. H. Woods, South Down, Bolton Road, Darwen.

# THE WORLD'S PREMIER CAMERA

Some of the many  
Leica features:

Leitz lenses specially computed for the Leica, interchangeable by screw flange, the most durable and accurate way.

Short base precision range-finder always showing both images, therefore most rapid focusing.

Shutter of durable, non-corroding material impervious to climatic influences.

Widest range of speeds from 1 second to 1/1000th second.

Separate setting of slow speeds 1 second to 1/8th second and fast speeds 1/20th to 1/1000th second,

## Leica

therefore no confusion when working in darkness in theatres, etc.

Elegant appearance and handy form without corners, thus making possible a perfect grip of the camera.

Housing of Duralumin, no casting, covered with vulcanised rubber looking like leather, but more durable and non-peeling; everlasting chromium finish.

**LEICA THE**

## FOR MINIATURE CAMERAS—"ET TOUT CE QUI S'EN SUIT"—THE ADVANTAGES OF GOING TO A SPECIALIST ARE MANY AND OBVIOUS

### MINIATURE ENLARGERS

The season of enlarging is at hand. Consequently we have amassed a large selection of the special enlarging apparatus now available for the various miniature sizes. We shall be pleased to supply descriptive literature on application.

THE ENSIGN MINIATURE MAGNAPRINT (enlarges up to 15×12 for 3×4 cm. negatives, with f/6.3 Ensar, £4 10s., or f/4.5 Dallmeyer lens.....)	£6 17 6
SPECIAL MODEL TO TAKE THE LEICA LENS (shortly available).....	£4 10 0
THE "RAJAH" (up to 10×8 in.), supplied with 3 metal masks to take 3×4 cm., 4×4 cm. and Leica size. Fitted with f/4.5 lens and special negative holder.....	£8 8 0
THE "RAJAH," for 6×6 cm. negatives.....	£14 5 0
THE FOTH. Supplied with ingenious adjustable mask taking 3×4 cm., 4×4 cm. and Leica size. Fitted with f/3.5 lens and 100-watt lamp.....	£8 15 0
THE BABY MIRAPHOT, fully automatic enlarger (no focussing). For 3×4 cm. or Leica negatives, enlarges up to 12×9 in., fitted with f/6.3 lens.....	£11 2 6
THE EXAKT, semi-automatic enlarger, for 6×6 cm. negatives, enlarges up to 10×10 in., f/4.5 lens.....	£18 0 0
THE LEITZ VALOY, for Leica, 3×4 or 4×4 cm. negatives, taking lens from Leica camera.....	£9 11 0
Fitted with Leitz f/3.5 lens.....	£15 4 0
THE FOCOMAT, as above, but fully automatic. The most beautifully made miniature enlarger.....	£16 6 6
With lens.....	£21 19 0
THE "CERTOS," 3×4 cm., 4×4 cm. and Leica size. The smallest and most ingenious of the miniature enlargers. Very compact and readily portable. With exposure calculator. Fitted f/4.5 lens.....	£9 9 0

We have an enormous selection of second-hand Miniature cameras, including all models of the Leica and Contax. Space prevents our describing more than a few, but the bargains contained in the following list are representative of what we have to offer.

#### LEICAS :

Model IIIa, f/2 Summar, ever-ready case. As new.....	£35 0 0
Model III, f/2 Summar, ever-ready case. As brand new.....	£29 17 6

# How I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CCXCVIII.

Mr.

A. R. TURPIN.

From information communicated to our Special Representative.

"ALTHOUGH I had been taking snapshots for over fifteen years, it was not until 1929 that I discovered that 'bang in the centre of the picture' was not usually the best position for the principal object; and that if there was nothing on the plate you could not get it there by intensification. In other words I had discovered 'The A.P.'

"From thence onwards I read every modern book on photography I could find, and wasted (?) countless packets of plates and papers photographing step wedges, and testing out different developers, until I felt that if I had not mastered the technique of photography, at least I could tell what was wrong with a print if it did not turn out as I desired. And this was worth knowing, at any rate.

"Then came 'pictorialism,' follow-

ing a visit to the London Salon. I soon found that trying to follow rules of composition was hopeless as far as I was concerned; so that I now photograph a subject as it pleases me, and leave it to my critics to tell me whether things are right or wrong, and why.

"I have no favourite camera, but prefer the miniature because I can have it always with me.

"I aim at a good strong negative, with the shadow detail well up on the emulsion curve. This latter point is very important in photogravure, which also happens to be my favourite printing process, because if the shadow detail is not strong it gets lost. I am surprised that there is not more exhibition work done by this process; it is certainly more inexpensive to work than bromoil if more than five copies are required.

"My own method of working photogravure is to make a transparency on glass, using Kodak Transferotype or Ilford dry-stripping paper. The glass side is then coated with matt varnish, and a pencil and stump used where greater strength is required.

"I use Autotype G. 22 tissue, because of its great speed, and expose a whole-plate print for five to ten minutes, eight inches from a 500-watt photo-flood light.

"Of course the photogravure process cannot be described in a paragraph or two. It has to be studied and practised, but it can be mastered by the amateur who makes up his mind to tackle it and succeed. In my opinion it is more than worth the trouble involved.

"Although photogravure is my favourite process I make quite a lot of bromide prints, on Kodapol for choice; but as I often have to stop down my enlarger in order to correct verticals, I find it too slow in such cases, and fall back on Kodak Royal.

"The two prints illustrating this article were taken on Ilford Supersensitive pan. film, without a filter, although I normally use one. They were taken at Uphill, Somerset, in the late afternoon.

"I have no qualms about faking, oiling, photo-montage, or anything I fancy, but rarely do these things because I consider it a crime if such work is apparent on the finished print, and this usually requires more patience than I possess.

"Finally, I would suggest that candid criticism is the greatest help a budding photographer can have; and to obtain this I would suggest joining a postal club. One can be so much more candid with a postman separating one from a fellow-member rather than just a clubroom table."

(A further example of Mr. Turpin's work is reproduced on one of the centre Art pages.)

THE GLEAM OF SUNLIGHT.

A. R. Turpin.

# Pictorial Analysis

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"IN A SWISS VILLAGE," by D. J. Stevens.

IN its rendering of an effect of sunshine; in its inclusion of a well-caught group; and in its literary content, this is a highly attractive picture, but it suffers, to some extent, from a certain lack of stability as well as from an absence of coherence.

The difficulties attendant upon securing such volatile subjects as children in surroundings of this nature, where their disposition and placing are matters of extreme importance, are well understood. The part that chance must play, too, is fully recognised, and, while it may be the case that no better rendering was possible in this instance, a knowledge of what is advisable may prove of service should a like opportunity recur in the future. Moreover, it is always desirable to aspire towards the ideal.

Part of the impression of instability arises from the exclusion of the base of the wall on the right and by the inclusion of the half-inch or so of the return wall on the same side. If an inch be taken away from that side, the impression is minimised, but it does not disappear altogether. It could only be thoroughly overcome if the line formed by the meeting of pathway and wall were fully visible, and, instead of running out across the baseline, it was made to meet the right-hand edge at least half an inch above the corner. The stone just there makes it more difficult, but, as far as can be seen, the addition of another inch to the base would correct matters, assuming, of course, that no patches of lighter tone were thus incorporated.

Naturally enough, the removal of part of the right-hand side and the addition at the base would make the picture shape too long for its width, and to adjust this it would be necessary to remove about two inches from the top. That, however, would be inclined to be beneficial, for it would exclude the patch of light in the

top left-hand corner, and, with this removed, one of the causes of the feeling of incoherence would be avoided.

To get rid of it entirely, it would be necessary to establish a more definite connection between the light on the figures (1) and that running down diagonally from top right towards the left-hand side (2). As the subject

the left, which is now in shadow. Then it should meet a vertical line of light stretching from that point upwards to the point (3). It would do quite well if the beam of light across the foreground met the upright pipe on the left, and if the pipe itself were illumined, the existing shadow on the wall being retained, for the pipe would then supply the required junction between the foreground light and the light above.

It would be equally effective if it could be arranged for a patch of light to stretch directly from the figure on the left to the point (3), in which event it would be wise to retain the existing shadows in the foreground and on the left.

What seems to be essential is a junction in light between the group and the point (3), and whether it is made by either of the two suggested alternatives or any other that is feasible is immaterial. It may be that somewhat earlier in the day a condition similar to the first suggestion might arise, and, later on, something in the nature of the second, but it should not be forgotten that the figures are practically a necessity—the subject would not be up to much without them—and it would be a matter of chance whether they occurred or not had the exposure been made at an earlier time or deferred till later.

In this sort of work it is rare that conditions are exactly as we would like them. Either the figures are right and the setting not what we would wish, or the setting is good but the figures either missing, ill disposed, or inappropriate.

Having regard to the circumstances, nevertheless, it is unquestionable that the picture, as it now stands, has a very considerable appeal; the sunshine being delightfully rendered, the group finely caught, and the texture of the stonework beautifully recorded.

"MENTOR."

stands, that is impossible, so what is needed is an extension of the beam of light across the foreground so that it meets a vertical stretch of similar tone to connect directly with the base of the light above in the neighbourhood of the point (3).

In the group itself, there is quite an adequate connection, but the light on the right-hand figure should join up with the light at his feet, just as it does at present, and run across from there right to the base of the wall on

# PICTURES by Novices

## SOME CRITICAL COMMENTS on the Beginners' prints reproduced on the opposite page

IT is very seldom indeed that a wide-open view of a subject, such as No. 6 of the prints reproduced on the opposite page—"Polperro," by R. N. Rook—can be made into a well-balanced and satisfying composition. It includes so many points of light and so many notes of deeper tones, all of which have some claim upon the attention, that no single element can be isolated as the centre of interest, and, in consequence, a sense of unity, which every picture should possess, is entirely lacking.

### Unity and Strength.

If it were possible for most of the lights and the greater proportion of the darks to be combined in one single item, the general tone of the remainder being in varying degrees of half-tone, there would be a better chance of all the elements pulling together in one united attraction, or, in other words, attaining unity.

Something might even be done, under a different lighting, with a subject seen from the same viewpoint, provided a sufficiently forceful item were introduced to make a centre of interest, but the lighting would have to be so arranged that the lights and darks were more or less merged and did not show the same extremes of tone. Such a state of affairs might arise under a *contre-jour* lighting, when all the buildings would be almost wholly in shadow, and, if a strong group of boats could be placed well in the picture, the ensemble might make up quite well.

The vessels now shown in the foreground are scarcely effective enough because, for one thing, they do not stand out from the setting at all well, and, for another, the absence of all their hulls robs them of significance. Besides this, the greater contrast of the setting has a bigger claim upon the attention, and, in fact, it really consists of a number of elements, each of which might serve as the subject material for a separate picture.

### Parts and the Whole.

It would be quite an interesting experiment to try and see how many subjects could be found in the present rendering. Two, at least, are fairly easy to pick out, and, with a little ingenuity, it is probable that the

number could be extended. Each of the parts in question might easily make up better than the whole, and, had they been chosen to stand alone in the first place, it is likely, having regard to the possibilities of the vicinity, that not only would they prove more truly representative of the spot, but, pictorially, they would reach a much higher standard.

No. 5, "Cottages, Bournemouth," by W. R. Chanter, does not show a similar dispersal of interest, for there is not the same multiplicity of lights and darks, but, all the same, it is not as well set out as it might be.

There is only the one light of any importance—that on the cottage wall on the right—and, as far as quantity is concerned, that is all very well, but the place for the principal light is not on the edge of the print, for the position is weak and cannot sustain any real attraction.

### Strength and Weakness.

Suppose another half-inch be added to the picture on that side, and that half-inch be composed entirely of shadow tone. Then, with the sunlit portion of the wall enclosed and removed from the edge, the case is entirely different and the composition shows strength instead of weakness.

In fact, with a little more tone in the sky it would make quite a nice thing, of its type, and it would not be surprising to find that, were the viewpoint farther to the rear, something in the nature of the suggested re-arrangement would offer itself. "Devonshire Sunshine" (3), by T. H. Messenger, is of much the same class, and how much advantage is derived from placing the principal light in the picture is visible at a glance.

The eye is immediately attracted by the strong light on the wall of the cottage on the right, and, because it is the brightest, as well as being well placed in the picture space, it is capable of sustaining that initial appeal. There is, in this instance, a dark intervening between it and the edge, which has the effect that the introduction of the suggested shadow would have in the former case. It isolates the light from the edge and conveys a sense of enclosure that heightens its value.

### Competing Attractions.

Nevertheless, the tone of the sky, here again, is a bit too bright, and there is a further note of competition in the sunlit opening in the wall on the left.

If the latter were smaller in area and the former were more subdued in tone, the feeling of competition would be avoided and the arrangement of the composition improved. Still, it does compare favourably with the other two, and more nearly achieves a sense of unity.

The sky tone in No. 4, "Harvest," by H. Brooks, approaches a depth which seems more desirable, for it accords with what might be expected to be the visual impression. Here, however, the darks of the shocks take the place of the lights in the examples previously discussed, and one of them should, by its depth of tone, scale and placing, be dominant over the rest, so that it can serve as the principal item of interest. The most prominent is the one on the extreme right, but, like the light in No. 5, it has not sufficient strength of position to maintain its importance over the rest.

### Position and Placing.

Were this element absent, the one next to it would do very well, but, as the print now stands, it is overshadowed by the nearer, and, similarly, in the case of No. 2, "Thatcher Rock," by S. Thomas, the pull of the trees and the attraction of the rock are too nearly equal for either to act as the centre of interest.

Another viewpoint taken from a little to the left would have separated them more, and it would be further improved had the camera been held a little lower so that the horizon, which is now half-way, broke through the top of the island.

As the print now stands, a trim of three-quarters of an inch off the left will lessen the pull of the island. Incidentally, the horizon, which is now sloping, should always be considered first in trimming.

No. 1, "Emsworth," by V. Redrup, unfortunately includes a type of house that does not improve the subject matter, and if it were trimmed away, nothing of interest would be left.

"MENTOR."

# With the Beginners

NOTES AND NOTIONS FOR THE  
LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

## CAMERA LIMITATIONS.—III.

TALKING (as I was last week) about very cheap cameras reminded me of another old friend of mine. He goes back to the far-off days when photographic "outings" were the regulation thing, and a jolly good thing too. Our cameras were more varied than ourselves, and that is saying a good deal.

I have seen one of the "outers" who used a 15×12 field camera (or perhaps it was only a 12×10). He carried one double slide, with two plates; and I have known him rack his camera out from here to yonder, replace the lens with a pinhole, give an exposure of one hour, and show the result in the next R.P.S. exhibition.

Another friend had little respect for any lens but a telephoto, and acted accordingly. Many of us had magazine box cameras, costing about a guinea, and loadable to capacity for a shilling. A few of us had reflexes—then something of a novelty, and a source of envy. Whatever we had we managed somehow to scoop up exhibition pictures, some of which are still famous in the annals of pictorial photography.

But the friend I mentioned first always had the same camera. It was an antique quarter-plate stand camera, and it still had some of the original parts. But it was

Fig. 1.

patched and botched beyond belief. He always carried with it an outfit of string, sticking plaster, adhesive tape, pins, tacks and goodness knows what besides, and spent part of every outing in first-aid to his aged and decrepit companion. And he was the best picture-maker in the whole crowd of us.

He knew what he could do with his camera, and he did it to perfection. He had to give a miss to many of the things which the others could tackle; and that reminds us that we must learn the limitations of our cameras, whatever they may be, and do the best we can in the circumstances.

This week I am using three illustrations to draw attention once more to a limitation which has become increasingly common, and about which I admit I am "faddy." It is one of the many bees in my bonnet, but I think its hum is worth listening to.

The fact is that I never feel really comfortable with a camera that has no rising front.

I feel a bit better if it has a bit of a rise for the vertical picture only; but I am much more at ease if the lens can be raised and lowered for both ways of the negatives. I may not want any such movement for subject after subject, but when I do want it I like to know it is there.

Now the absence of a rising front is not one of the limitations of "cheapness." Far from it. As I said last week, my nine-and-tenpenny camera has ample rise and fall both ways; but some of the most costly cameras of to-day have the lens fixed immovably exactly opposite the centre of the plate. I heard of a salesman who told a customer that as these cameras are generally used at eye-level, a rising

Fig. 2.

front was unnecessary; but he was something else as well as a salesman.

A friend of mine who uses one of the most costly of these instruments says he does not want a rising front. If he cannot get the top of his subject in with the camera level, he points the camera up; and as he never makes contact prints (which would be too small to see) he corrects the distortion in enlarging. At least that is what he thinks he does, and perhaps it would be unkind to deceive him.

As to the illustrations. These are some of my wayside notes on the hasty trip which took me past last week's cornfield. In Fig. 1, although it is not very apparent, the street runs downhill from where I stood, and I could comfortably include what I wanted with the lens central. This again is the type of subject within the scope of practically any camera.

Fig. 2 was a very different case. I took this subject for the benefit of someone else, although I should have been tempted to take it, anyhow, if only for the sake of its name. For does not "The Marquis of Granby" instantly bring before us the figures of old Tony Weller and his immortal son Sam?

Anyhow, I had to get this particular view in a narrow street, and even by cutting down the foreground to the irreducible limit I have only just managed to include the indispensable signboard. The rising front just did it; otherwise I should have had to tilt the camera and

Fig. 3.

"correct" the inevitable distortion. I prefer my own plan.

My only reason for taking Fig. 3 is that I cannot help myself. I could not pass such a cottage if I had a film unexposed. You see that this, too, is a good fit, but a pretty tight one; and here the rising front was wanted the horizontal way. The original is a perfectly straight enlargement, with no "corrections" of any kind. W. L. F. W.

## September Mornings

By  
H. W. HONESS LEE.

THE character of subjects in the early morning, especially a September one, is very fascinating. "There is something inexpressibly beautiful in the unused day, something in the fact that it is still untouched, unsoiled, and town and country share alike in this loveliness. At half-past seven on a fine morning even London has not assumed her responsibilities, but smiles and glows light-hearted and smokeless under the caresses of the morning sun."

One of the natural features of the early hours is the morning mist—a fulsome yet magnificent silvery veil, full of light from the sun, yet semi-opaque, when all shadows are attenuated as to form—and it is the mist that is of such a great help in picture-making. So many subjects which are hopeless under ordinary clear atmospheric conditions assume quite a pictorial aspect when enveloped in mist; instead of objects being depicted with microscopic detail, or with violent contrasts of light and shade, they are merely suggested with gentle contrast, and the imagination clothes the scene with the glamour of its own creation.

What other medium is better able to record these misty effects than photography? In the early morning, when the landscapes are bathed in mist, the objects become masses of soft, subtle tones rather than clearly-defined variations of colour, and it is in the recording of these subtle tones that the camera excels.

Woodlands are at their best in the early hours of the autumn mornings; the autumn mists are not so evanescent as at other seasons, and it is possible to make woodland pictures as late in the morning as ten o'clock before the mist disperses, and there is the added charm of the sun being fairly high in the heavens to make the mist vibrate with lightness and airiness and to form delicate and pleasing patterns. And not only does the mist help any attempt at decorative effect, but it also helps to obliterate that objectionable detail with which, in the middle of the day, it is so difficult to deal. It is also to be remembered that, when mists prevail, the trees are usually very still, giving ample opportunities for generous exposures, and this stillness seems to give the woods much breadth of effect and repose.

Photography in the city is also worthy of pursuit on a September morning, and here again the presence of mist will be found to be of great advantage, for much of the ugliness of the modern buildings becomes lost, and mere soft, silhouettes take its place. Not only in the streets but also along the river the mist is responsible for many pictures which otherwise would never exist, and quite a number of the occupations of London are carried on in the early morning, affording the photographer ample opportunities for figure studies before the advent of the business people makes selection much more difficult.

Just a few words on the technical side will not be out of place. The silvery mist of a September morning is fairly actinic in value, but full exposures should always be given, and the plates or films developed to give soft negatives so that faint detail is retained in the shadows whilst the delicate tones of the high-lights are not blocked up. A print on a smooth paper and in high key usually portrays the atmospheric conditions to the best advantage.

# Picture Points

## for Beginners, by RICARDO

### Cloud and Sky Effects

There are very few landscapes or seascapes which are not improved by showing clouds in some form or other on the print, instead of leaving only blank white skies.

If there are no clouds present at the moment of exposure, double printing with another negative showing clouds that are suitable, both in character and lighting, will have to be made.

On the other hand, strange as it may seem, there are occasions when the clouds can be too strong and attractive and have to be toned down or even trimmed off.

This point rests entirely on the subject matter, or the *motif* of the picture. In all pictorial prints there should be one major point of interest which all the other items in the picture should support, but be subordinate to in attraction value.

With a subject like the second sketch, where the sky is of minor importance, to show well-defined clouds is to attract the attention away from the main point of interest, and so calls for soft, unobtrusive clouds instead.

In the first sketch we have a landscape that depends entirely on its cloud formation for its appeal, while the hedges and tree are of quite secondary importance, although they are absolutely necessary to the scheme.

### Good and Bad "Drawing"

The beginner is often confused with the terms of modelling, drawing and perspective when applied to pictorial photography.

Modelling was explained in last week's series, and we shall now discuss briefly the effect of good and bad drawing. To illustrate this point effectively, it is necessary to use articles of known proportions, and although the term of drawing can be applied to almost every subject, from landscape to portraiture, a still-life group of articles in everyday use will suit our purpose best.

If we study the two sketches for a minute or two, we shall discover the meaning of good drawing. The negatives of both of these could be taken by the same camera and lens, and yet the print of one, the lower sketch, is undoubtedly the more pleasing.

This is difficult to explain fully in a few words, but to say it looks more natural will perhaps put the case in a nutshell. The top sketch shows that the camera was too near to the subject, a mistake that most novices make in an attempt to fill the view-finder or focussing screen. This can only result in making the nearest object look, on the print, unnaturally larger than the farthest object. The lower sketch is a bigger enlargement of the negative, since if the camera were placed farther away the image on the negative would be smaller than the first. Six feet away from the subject is a safe distance.

If the camera is placed too near for portraiture we shall have the same effect. The features nearest the camera will look too big and those farthest away will look too small.

### Three-Quarter Front Lighting

Last week, in this series, we explained the term "modelling," and showed how side lighting was the best for certain types of subjects. There are many other forms of lighting, and of these the three-quarter, or 45°, front lighting is undoubtedly the most useful of all, particularly for solid objects.

Obviously, one cannot lay down the law for direction of lighting, as each type of subject demands particular treatment, but the beginner cannot do better than to master this 45° method before trying out "stunt" lighting.

For orthodox portraiture, where one wishes to draw attention to the character of the sitter rather than to the lighting used, 45° lighting is excellent, since it brings out the best modelling of the features in the most pleasing manner.

If we examine the first diagram we shall see the effect of four different lightings. A sphere is used, as it is the best example to show the full effect of tone gradation of a three-dimensional subject.

Each has its own particular use, but the last one is undoubtedly the most pleasing, since it gives both good modelling and variety of tone.

Referring to the second sketch, we can now see how this three-quarter front lighting is obtained. The angle of 45° is applied twice, as shown on each of the two diagrams. In the top view the lamp is shown on the right of the camera, but it is immaterial whether it is on the right or left.

# Now take it in

# COLOUR!

ANYONE who can take ordinary snaps can now photograph in natural colours. No special apparatus is required, not even a colour filter. With your ordinary camera and a spool of Dufaycolor film you are ready to make pictures which reproduce faithfully the colours of the original scene.

Buy a spool now and learn how simple Dufaycolor photography really is. There is nothing to learn—the beautiful colour transparencies will amply repay you for the slight extra cost of Dufaycolor film.

YOUR PHOTOGRAPHIC DEALER CAN NOW SUPPLY

# DUFAYCOLOR

## ROLL FILMS & FILM PACKS

**FOR AMATEUR CINEMATOGRAPHERS**

Natural colour photography is also available for the amateur cinematographer using 16 mm. cameras. DUFAYCOLOR CINE FILM IS SOLD IN 50 FEET AND 100 FEET DAYLIGHT LOADING SPOOLS. No additional attachments are required, but a plain single-colour daylight compensating filter is supplied free with each carton of film.

CLOSING DATE  
Thursday, October 31  
1935

## ANNUAL Lantern-Slide Competition 1935

EVERY reader of *The Amateur Photographer* who is interested in the making of lantern slides should participate in "The A.P." Annual Lantern-Slide Competition. Not only are the seven classes comprehensive in their variety of subjects to suit all workers, but inclusion of slides in "The A.P." prize set which circulates throughout the British Isles can be considered as the hall-mark of excellence, which every lantern-slide maker should strive for. Each succeeding year the competition proves increasingly popular, and has come to be regarded as a test of merit in lantern-slide production. We hope, therefore, that again this year every lantern-slide maker will enter the competition. The conditions and awards are set out below. It should be noted that

the awards are made to individual slides and not to sets; but every competitor can send as many slides into as many classes as he or she desires. The slides are judged on the screen under the best conditions. After the judging the prize-winning slides, and a number of others which are selected for purchase, form the exhibition collection which goes on tour to all parts of the country for a year or more. Secretaries of photographic societies who have not yet booked the set of "A.P." Prize Slides should hasten to do so, and submit alternative dates. This is necessary to enable a complete and expeditious itinerary to be arranged before the slides start on their journey in November. In the meantime, those who intend entering this competition should note that the closing date for receiving entries is Thursday, October 31st.

### Classes and Subjects.

- CLASS I.—Landscape with or without figures, sea subjects and river scenery.  
CLASS II.—Portraiture and figure studies, whether indoor or outdoor pictures.  
CLASS III.—Architecture, interior and exterior.  
CLASS IV.—Flowers, fruit and other "Still-Life" subjects.

- CLASS V.—Natural History subjects.  
CLASS VI.—Lantern slides in colour (not hand-coloured).  
CLASS VII.—Champion Class. Open only to those who have won silver or bronze plaques in *The Amateur Photographer and Cinematographer* lantern-slide competition.

### Conditions and Awards.

(1) All classes are open to amateur and professional photographers without any restrictions. All slides must measure  $3\frac{1}{2} \times 3\frac{1}{2}$  in., and must be properly spotted for showing in the lantern.

(2) One silver plaque, one bronze plaque, and four certificates are offered in each class except Class VII. In that, the Champion Class, the award will be a mounted and signed exhibition picture by Mr. F. J. Mortimer, the Editor of *The Amateur Photographer and Cinematographer* and *Photograms of the Year*.

(3) All slides which receive any award will become the property of *The Amateur Photographer and Cinematographer*, and will be sent round amongst the societies and such other associations as apply for the loan of them. Any other slides may be selected for circulation in this manner, and will be paid for at the rate of half a crown each.

(4) Competitors may send any number of slides in any class, and may be recorded as winning any number of awards; but no competitor will actually receive in the competition more than one silver plaque, one bronze plaque, and one certificate, on which all his awards will be recorded. Competitors may enter in any number of classes.

(5) Each slide must bear the competitor's name, its title and its class. With the slides must be sent an envelope containing the name and full address of the competitor, a list of

the titles of all the slides he is sending in, and the class in which such are entered. Particulars as to make of plate, exposure, developer used, etc., and other technical data which may be of interest for incorporation in the notes which will accompany the winning slides on their tour among the photographic societies, should also be given where thought necessary.

(6) A stamped and addressed label (not loose stamps) should be sent with the slides for their return if unsuccessful; but in no circumstances can the Editor or the Publishers accept any responsibility for slides sent in for competition, nor for their return; neither can slides be returned which are not accompanied by stamps as above.

(7) Not more than one slide from any one negative can be admitted, nor may any slide compete which has before won an award in these competitions.

(8) The last day for receiving is Thursday, October 31st. The slides must be well packed and addressed, "Slide Competition, The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and all carriage charges must be prepaid.

(9) In any case of dispute, the competitor agrees to accept the decision of the Editor of *The Amateur Photographer and Cinematographer* as final.

# Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

## Railway Cinematography

By  
P. H. BRAITHWAITE.

With the admirable network of railways all over the kingdom, the ciné worker need not go far to make a complete and interesting reel.

THERE is good material for the ciné enthusiast on or near a railway line, by providing constant movement and life so essential in cinematography.

Actually the best shots to be secured are those outside a main line station, or, better still, a few miles away where passing trains have got up speed. The interiors of certain London and provincial termini are unsuitable for ciné work owing to the prevalence of smoke which persistently hangs about. In any case, apart from the bustle of passengers, there is little actual train movement to attract, excepting arrivals and departures, which should be filmed from an outside position such as an extreme end of a platform.

### Trains in Motion.

Unique shots of trains in motion can be obtained by suitably selecting a sector of track. Approaching trains offer attractive scenes and should preferably be taken at an angle of 45 degrees. Carefully panning the camera with the movement of the train can be undertaken if desired, but right-angle filming should be avoided. Where it is possible to approach the line fairly closely, ideal shots can be registered from a point just above rail level. In this case the camera will have to be pointed slightly upward towards the oncoming train, giving an impression of power and strength. Do not venture too near the rail, eight or ten feet away is ample, or not only will there be a possibility of a prosecution for trespassing, but there may be a risk of escaping steam from passing locomotives.

Actually, the "iron horse" is a good actor, and an interesting complete film can be made embracing a day in the life of a locomotive by planning out beforehand likely shots. The film should start with the engine being coaled and watered near its shed. Although the locomotive is stationary during this process, there is constant animation by the shedmen engaged upon it, and by the driver and fireman as they oil outside working parts. A shot can next be secured of the engine backing on to its train, followed by a few feet exposed on the busy platform with its passengers. A near shot of the signal falling for the

"right away" should next be secured. For the scene depicting the actual departure of the train, a position should be taken up at the end of the same platform from which the train is leaving, thereby enabling a full view of the approaching locomotive and carriages being taken.

### Shots en Route.

Shots of the train actually on its journey can be secured by journeying a few miles along the route and filming it at speed. Taking several lengths of film from different positions in this manner will enable the film to be gradually built up to cover the train's progress. If one is actually travelling by the train itself, scenes can be taken of countryside, stations, or suitable landmarks passed *en route*, together with the arrival of the train at its final destination. To

complete the film, the locomotive can be filmed being uncoupled from its train and its last journey to the running shed.

### For Continuity.

The whole of the scenes cannot, of course, be secured in a day, so care must be taken that each scene embraces the same train in each case, together with the identical class or type of engine.

If desired numerous unique shots can be included in the film, depicting such items as the driver moving his starting lever at the "right away" or a scene showing the train at speed secured from another train travelling in the same direction. One does not need to be a railway enthusiast to realise that there is abundant scope for originality on our railroads.

Trains in motion provide interesting and realistic material for the ciné-man. This is the "Leeds Flyer" at Welwyn.

# " — Saves Nine ! " By "LONE WORKER."

"THIS not in mortals to command success, but we'll do more, Sempronius, we'll deserve it." Or, at any rate, we'll try to!

Towards the end of the summer all amateur cinematographers—even "lone workers"—look back over the season's work with some regret. There were so many things we meant to do, and haven't done.

We intended to work strictly to scenarios, in the approved textbook style, but somehow or other we simply shot what took our fancy. So here we are with several assorted lengths of film, most of which can be fitted together after a fashion, leaving odd feet here and there without a meaning.

## Everything is Good.

Because an exposure meter was used everything is projectable. The question is whether, when projected, there is anything on the screen but a series of animated snapshots.

We can reply to that question with another—can these casual pieces be welded into a whole?

Fortunately, the answer is always that they can. After all, there are a few more bright days before the summer is over; on these days we can fill the gaps in continuity.

What makes for quality and interest in a film? The essence of a movie is that it shows transition—a good sequence shows steady progress along one line of thought; a poor effort loses its grip because it fritters away the mental energy of the audience by chasing them up and down the garden path.

## Telling the Tale.

Personal movies are bits of history. Every family has a different story, but by taking an example from one we may set in order our ideas of what kind of additional shots are necessary to make any story coherent.

There is, for instance, that excellent shot of father at his old office, made on a short end to fill up the spool for processing. It turns out too good to waste, but it doesn't belong anywhere.

Father has left that office, having got a better job, although it meant longer hours. So we will start with a close shot of father smiling over a letter, followed by another of the letter of appointment.

Then we will reconstruct at home a corner of his new and elegant office desk. Father works late (photo-flood in a standard lamp; shot of father and then of the clock on the desk) and mother has to wait for him (shot of the dining-room clock, panning to mother knitting and yawning. The table is laid for two).

## Waste Nothing.

The economist may be shocked. Ten feet of film exposed to make use of a four-foot short end? But with the title "Father gets a step!" the whole fourteen feet say something; the odd four feet would need to be explained.

Every foot of film already exposed is part of the family life. Disjunct sentences are meaningless unless we write the rest of the story. Write it now, before the characters change. Then the "wasted" film becomes a useful piece of work.

Continuity of action can deceive an audience into thinking there is continuity of space and time. If you follow a long shot of play on the centre court at Wimbledon with a shot from the bedroom window of Janet serving from a well-marked base-line on the family lawn the audience will believe that Janet reached the Mecca of tennis fans.

## Splendide Mendax.

Yet the family lawn may not be big enough for ping-pong, let alone tennis. If the boundaries do not show

on the screen, who is to know that there was neither net nor opponent when Janet served?

Similarly, by taking a little thought, you can fill up the gaps in your holiday film with close-up shots near home. With a little improvisation you may even introduce "local colour."

If, for instance, the last holiday spool ran out on a shot of the outside of those pretty tea-gardens, then a little table and a "waitress" under a tree at home will suggest the interior. Why not?

An afternoon by the seaside will enable you to record the close-ups that you were unable to get, or forgot in the excitement, during your holiday. The waves at Brighton are not unlike those at Seaton, and the same sun shines on both. So long as you avoid the pier and the promenade there will be nothing to betray your little fraud.

## A Finished Touch.

By this plan we get most of the advantages of a scenario with the spontaneity of impromptu filming. As a precaution it is best to refresh the memory by running through the projector all the processed film of the season, making written notes of the gaps that need to be filled. It may be necessary to see the film two or three times to make a good job of it.

Then expand the notes with remarks on lighting and type of costume—these are items that can easily be overlooked. After this has been done it is easy to plan out an afternoon's shooting to wind up the season. Possibly two afternoons may be needed, one in the country and one by the sea.

## The Reward.

Not an unpleasant programme, is it? And the satisfaction that will come when you start editing in the autumn will be surpassed only when, after the winter shows, the audiences say, "Every second of it was interesting!"

# The Week's Meetings

*Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.*

## Wednesday, September 11th.

Rochdale P.S. Choice of Papers.  
S. Suburban and Catford P.S. "Star Turn" from Cripplegate Society.

## Thursday, September 12th.

Bury P.S. Annual General Meeting.  
Medway A.P.S. "The Aim of Portfolio Circle." W. H. Willis.  
N. Middlesex P.S. Lectures.

## Saturday, September 14th.

Dennistoun A.P.A. Cardross.  
Hull P.S. "Hedon and Paull." A. H. Hale.  
Leicester and Leicestershire P.S. Ashby-de-la-Zouch.  
L.C.C. Staff C.C. Oxted.  
Luton and D.C.C. Ickleford.  
N. Middlesex P.S. St. Albans.  
Nottingham and Notts P.S. Cromford and Matlock, Bath.  
Partick C.C. Dunlop.  
Sheffield P.S. Rotherham Parish Church.  
Southend-on-Sea and D.P.S. Rochford.  
Stockport P.S. Romiley-Chadkirk.  
Walthamstow and D.P.S. St. Bartholomews.  
Worthing C.C. Warminghurst and Thakeham.

## Sunday, September 15th.

Stafford P.S. Bradley and District.  
Worcestershire C.C. Knightwick.  
York P.S. Sand Hutton and Buttercrambe.

## Monday, September 16th.

Southampton C.C. "Printing Papers and Their Peculiarities." W. R. Kay.  
Walthamstow and D.P.S. Theatre Work.

## Tuesday, September 17th.

Hackney P.S. "Combination Enlarging." G. Crosby.  
Manchester A.P.S. Social Evening.  
Nelson C.C. Lantern Lecture. H. Horne.  
St. Bride P.S. "After-treatment of Negatives." G. M. Maynard.

## Wednesday, September 18th.

Borough Polytechnic P.S. "Wild Life of the English Countryside." J. Davis.  
Luton and D.C.C. Ickleford.  
Partick C.C. Print Criticism.  
Rochdale P.S. An Evening with Mr. J. Hargreaves.  
Stockport P.S. Chloro-Bromide Demonstration. J. C. Egan.

# Letters to the Editor

*The Editor is not responsible for the opinions of his correspondents.*

## A CAMERA CASE.

SIR,—I wonder whether it has ever struck readers of your paper who use Leicas how handy is a case the  $3\frac{1}{2} \times 2\frac{1}{2}$  plate camera fits? I refer to the cases of 6 in. height, 5 in. width, and 4 in. breadth, not the long kind. This type of leather case will accommodate a Leica outfit exactly, viz., Leica Model I with Vidom finder in position and Elmar 50-mm., Elmar 35-mm. wide-angle lens, a 9 or 10.5 cm. long-focus lens, an Ombrux exposure meter, three filters, two lens hoods (and also in my case a Balda range-finder). All this fits exactly into a case of the description mentioned, velvet-lined, which I bought at Wallace Heaton's, Avery Row, for 2s. 6d. second-hand—there were several others. There is no rattling; all the components fit exactly, with no room to spare, and the case is not strained.

The camera, standard lens, and view-finder fit along the 4-in. side, downwards, and with a lens hood leave exactly space for the Ombrux in the bottom. Above this fits the long-focus lens, and another lens-hood keeps the distance between the body of the camera and the side of the long-focus lens. Next to the film winder and over the Vidom goes the 3.5-cm. lens with caps. A filter fits in position on each lens, and the outfit is complete, and as compact as can be imagined. There is room for a few oddments, such as a spare film-chamber, self-timer, wire release, etc.

For those who do not wish to go to the expense of a case for the whole outfit, such as those specially made by Leitz, the idea is a good one.—Yours, etc., "ECONOMICUS."

## CAMERA MOVEMENT.

SIR,—With reference to camera movement, I give below a practical result which may help to clear the matter up.

Pictures were taken of two spots of light (20 in. apart, 30 ft. from the lens), using a 19-in., a 12-in. telephoto, and a  $5\frac{1}{2}$ -in. lens. Two pictures were taken with each lens, rotating the camera through a small angle (the same for each lens) between the exposures. It was possible to get all six exposures on one plate.

By measuring the distance between the images of the two spots, the relative image sizes for the three lenses could be obtained. The distance separating two images of the same spot gave the image shift for the angle of camera movement used.

The mean of five different determinations is given below. It will be seen that the two ratios are the same, showing that the image movement varies directly as the effective focal length (since this determines the image size).

Lens used.	Ratio of Focal Lengths.	Image Size.	Image Movement.	Ratio of Image Sizes.	Ratio of Image Movement.
19 in.	1	2.86	4.19	1	1
12 in.	0.632	1.87	2.75	0.655	0.654
$5\frac{1}{2}$ in.	0.276	0.80	1.17	0.280	0.279

The angle of camera movement was approximately  $4^\circ 48'$  with the front bottom corner of the camera as pivot. The agreement of the image size ratio with the focal length ratio would have been better if the two lights had been farther away. The close agreement in the last two columns is, in view of the crude apparatus used, a fluke. But the maximum deviation from the mean was only about 2 per cent.

In conclusion, I feel sure that the slight difficulty in holding miniature cameras is due to their light weight.—Yours, etc., V. L. BREEZE.

## MY IDEAL CAMERA.

SIR,—The advent of the new Zeiss Ikon camera giving pictures  $2\frac{1}{4}$  in. square prompts me to write this.

I think this will soon become the most popular size. Few pictures are of the square shape, but most  $2\frac{1}{4}$ -in. square negatives are to be enlarged, so why worry? Moreover, one gets a comfortable number of negatives from the most popular size film.

But, to my mind, a camera somewhat simpler than those on the market would pay for production and it should have a rising front of not less than three-quarters of an inch. Less than this is not worth having.

My ideal would be a folding camera of their type built like a Sibyl camera with a friction rising front (racks and screws are quite unnecessary), with a frame finder (optical ones give too small an image, and easily get finger-marks)—and why, in the name of simplicity, do such cameras have to have a film counter? Why don't film manufacturers print a further set of Nos. 1 to 12 down the middle of the paper backing? All that is then wanted is a plush-surrounded window in the middle of the camera back!

Finally, a 3-in. f/2.9 lens in a No. 0 delayed-action Compur shutter would almost complete the outfit. The finishing touch would be given if one of the mathematicians in the lens factories could compute a lens in which the front component could be removed (bayonet type fixing, please!) and a telephoto component substituted. I believe this would mean that the rear component would have to be of a negative lens, but is this difficulty insurmountable?—Yours, etc., A. A. PIZEY.

P.S.—Need such a camera cost more than £10, exclusive of the telephoto component?

## THE ENLARGER PROBLEM.

SIR,—I have been away from home and thus have only just seen your issue of the 19th June, but hope this letter will not be too late to help your correspondent "H. W."

In the first place I should most certainly advise him to have a condenser type enlarger. It is a very simple matter to fit a sheet of ground glass between the condenser, and thus diffuse the light when required, and this only costs a few pence.

My second point will probably very greatly help him in deciding the size. I, too, among my cameras, use one taking 16 on  $3\frac{1}{2} \times 2\frac{1}{2}$  film. Provided he adjusts his exposures in pairs when making his negatives this will enable him to enlarge two prints on one sheet of paper, and this I find a great saving of time. Thus a  $3\frac{1}{2} \times 2\frac{1}{2}$  enlarger is indicated.

I am not quite sure if I have made myself clear, but I try to make my exposures so that each pair of negatives are of approximately even density, and when the film is developed and dried I cut it into eight pairs rather than sixteen separate strips, and enlarge two at once in a  $3\frac{1}{2} \times 2\frac{1}{2}$  carrier.

Finally, I should strongly advise your correspondent to get an old half-plate enlarger if he has room for it. Owing to the popularity of the miniature camera, these half-plate enlargers can now be picked up very cheaply, and one can buy quite excellent old R.R. lenses of various focal lengths for about 2s. 6d. each.

I do not suppose he will always use this small size, and a reasonably large enlarger with a nest of carriers (which are easily made) can deal with almost any size negative.—Yours, etc., J. C. SCOTT.

## SHUT-OUT FOR DARK-ROOM.

SIR,—Your enquirer, G. L. (Rotherham), will find that if he strains a piece of calico over his frame, and then pastes a sheet of brown paper over each side of the fabric, he will have a durable and light-excluding screen. A screen so made, I know from my own experience, will last for years.—Yours, etc., ERNEST MARRIAGE.

# Readers' Questions ANSWERED

**GENERAL.**—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1." and in every case, without exception, must give the name and address of the writer.

**CONTRIBUTIONS.**—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

**ENQUIRIES AND CRITICISM.**—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a *separate* stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

## Waterproofing Dishes.

I wish to make some wooden dishes for developing enlargements. What is the best means of making them both water-tight and impervious to the chemicals?  
D. R. (Exeter.)

One method that answers well for a time is to apply two or three coats of melted paraffin wax all round the inside and outside of the dish, and then "iron" it well with a hot flat-iron. Alternatively, the wood can be sealed thoroughly, and, when dry, two coats of Brunswick black or good cellulose enamel should be applied.

## Identifying Plates.

Is there any way of marking plates so that they can be identified after processing?  
M. B. (Oxford.)

The simplest and most effective way we know is to mark a number on the emulsion side, as near the edge as possible, with a lead pencil. Do not use a copying ink pencil as it has a tendency to "run" in the developing bath. If the negatives are scratched with a pin prior to development frilling is caused, and consequently the marks are obliterated.

## "Hard" and "Soft" Negatives.

What is meant by a "hard" and a "soft" negative?  
C. S. T. (Oldham.)

The terms "hard" and "soft" apply to the scale of tone gradation, and do not refer to the consistency of the emulsion. A "hard" negative means that it has a short scale of gradation, beginning with clear and ending with extremely dense patches, with very little intermediate tone gradation in between. Such a negative usually results in prints that are known as "soot and whitewash." On the other hand, a "soft" negative has a relatively long scale of tone gradation, with no absolutely clear and dense portions at either

end of the scale. This type of negative is best for portraiture and subjects where sharp contrasts of tone are not desirable.

## Panchromatic Films.

What is wrong with the enclosed negatives? They were developed by a local chemist.  
I. J. L. (Southgate.)

Although you do not mention it, it is undoubtedly a panchromatic film that has been exposed to the usual red light prior to development, and has consequently become reversed into a positive instead of remaining as a negative. Always mark such panchromatic films clearly when handing them to other people to process.

## Drying Roll Films.

What is the quickest method of drying roll film after washing?  
C. C. (Forest Gate.)

Give the film three minutes' soaking in a ten per cent solution of formalin to harden the emulsion, wipe off the superfluous moisture with clean chamois leather, and then place it in a current of warm, dry air. Do not attempt to dry it by repeated immersion in methylated spirit, as can be done to plates, as this will cause the celluloid base of the roll film to cockle.

## Copyright.

I want to copy some photographic illustrations that were published in a monthly magazine about nine years ago. As my reproductions will be used only for home decoration shall I be infringing anyone's copyright?  
A. D. (Southampton.)

You will certainly be infringing copyright if you copy the illustrations. It does not matter if you intend to use the reproductions only for home decoration, the act of copying, whether by camera or by hand, is an infringement of the Copyright Act of 1911. All photographs are covered by this Act in the British Empire for fifty years from the making of the original negative.

## Amidol Solution.

Is there any way of keeping amidol developer in solution ready for use instead of having to weigh out the chemicals immediately before use?  
B. J. D. (Stirling.)

Amidol developer soon loses its best qualities if kept ready mixed for any length of time. Much time can be saved, however, if the sodium sulphite is dissolved beforehand and the necessary dry amidol is added just before use. Dissolve 4 oz. of sodium sulphite crystals in 80 oz. of warm water, and add 2 oz. of potassium metabisulphite. For use, take 3 oz. of this stock solution and add 10 grains of amidol, and, if necessary, 5 to 10 minims of 10 per cent solution of potassium bromide as a restrainer. This is a suggested strength suitable for most films, plates, and bromide papers.

## Straightening Out Prints.

What is the best way to remove the curl from bromide enlargements?  
G. D. (Blackpool.)

The easiest way is to take an ordinary flat wooden ruler, and, after placing the print face downwards on a clean piece of paper, take hold of one corner of the print and with the ruler held firmly in the other hand draw the ruler away from the corner. This should be repeated from all four corners of the print. Note that the ruler only is moved and not the print as this would cause friction and possibly scratch the bromide surface. If a hardener has been used in the fixing solution, this method of straightening sometimes results in cracking the surface and it would be advisable, in this case, to blot off the surplus moisture and lay the prints face down to dry on a flat clean surface covered with muslin. The prints will then be found to dry with only a very slight curl.

## Dry-Mounting Bromoils.

Can I mount bromoil prints by the dry-mounting process or will it affect the pigment?  
A. C. C. (Enfield.)

Provided that the pigment is quite hard, it is quite safe to use the dry mounter. While some bromoils will dry sufficiently hard in three or four days, others will take a week or two. It just depends on the consistency and amount of ink used.

## Blue Spots on Prints.

I am constantly finding blue spots on my sulphide-toned prints. What is the cause?  
A. J. (Ilford.)

These blue spots are probably caused by minute particles of rust in the water. Take the precaution of tying flannel over the tap spout for all photographic purposes.

## Diameter of Condenser.

What size condenser shall I need for my quarter-plate enlarger?  
M. C. (Walsall.)

Assuming that your negative will lie close to the condenser, a condenser of 5½-in. diameter is advised. To check this place a negative on a piece of paper and run a pencil all round the edges. Then take a pencil compass and make a circle just large enough to include the four corners of the negative. The condenser should be the same diameter as the circle, but if a movable carrier is used this must be allowed for.

# The Amateur's Emporium

## Business Notices

### Publishing

**OFFICES.**—Dorset House, Stamford Street, London, S.E.1. Telegrams: "Amaphot, Sedist, London." Telephone: Hop 3333 (50 lines).  
**PUBLISHING DATE.**—"The Amateur Photographer and Cinematographer" is on sale throughout the United Kingdom every Wednesday morning.  
**SUBSCRIPTION RATES.**—British Isles 17/4 per annum, Canada 17/4, other countries abroad 19/6 per annum, post free.  
**REMITTANCES.**—Cheques, etc., should be crossed and made payable to Illife and Sons Ltd. "The Amateur Photographer" can be obtained abroad from the following: **UNITED STATES:** The International News Co., New York. **FRANCE:** W. H. Smith & Son, 248, Rue Rivoli, Paris; Hachette et Cie, Rue Reaumur, Paris. **BELGIUM:** W. H. Smith & Son, 71-75, Boulevard Adolphe Max, Brussels. **AUSTRALIA:** Gordon & Gotch, Ltd., Melbourne (Victoria), Sydney (N.S.W.), Brisbane (Queensland), Adelaide (S.A.), Perth (W.A.), and Launceston (Tasmania). **NEW ZEALAND:** Gordon & Gotch, Ltd., Wellington, Auckland, Christchurch and Dunedin. **INDIA:** A. H. Wheeler & Co., Bombay, Allahabad and Calcutta. **CANADA:** Imperial News Co., Toronto, Winnipeg and Vancouver; Benjamin News Co., Montreal; Gordon & Gotch, Ltd., Toronto. **SOUTH AFRICA:** Central News Agency, Ltd.

### Displayed Advertisements

Communications on Advertisement matters should be addressed: The Advertisement Manager, "The Amateur Photographer and Cinematographer," Dorset House, Stamford Street, London, S.E.1. Copy for displayed advertisements for the issue of any particular week must reach Dorset House by the first post on Tuesday morning in the week previous. Rates and conditions will be sent upon application.

### Prepaid Advertisements

**SALE AND EXCHANGE: AMATEURS ONLY—**  
 12 words or less ..... 1/-  
 1d. for every additional word.  
**PROFESSIONAL AND TRADE:—**  
 12 words or less ..... 2/6  
 2d. for every additional word.

Each paragraph is charged separately.

**SERIES DISCOUNTS** are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.  
 All advertisements inserted in these columns must be strictly prepaid and posted to arrive at the Head Office, Dorset House, Stamford Street, S.E.1, not later than first post FRIDAY for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 260, Deansgate, Manchester, 3; 23b, Renfield Street, Glasgow, C.2.

Advertisements are inserted, as far as possible, in the order received, and those received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

Postal Orders sent in payment for Advertisements should be made payable to **ILLIFE AND SONS LTD.**, and crossed

& Co.

Notes being untraceable if lost in transit, should not be sent as remittances.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

**BOX NUMBERS.**—For the convenience of advertisers, letters may be addressed to numbers at the office of this paper. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charges, which must include the words: "Box 000, c/o 'The Amateur Photographer'." Replies should be addressed: "Box 000, c/o 'The Amateur Photographer,' Dorset House, Stamford Street, London, S.E.1," and these letters will be simply forwarded by us to the advertiser. It must be understood that we do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisement. Readers who reply to Box No. advertisements are warned against sending remittances through the post except in registered envelopes. In all such cases the use of the "Deposit System" is recommended.

### Special Note

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post. When sending remittances direct to an advertiser, stamp for return should also be included for use in the event of the application proving unsuccessful.

### Deposit System

Readers who hesitate to send money to advertisers in these columns may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Amateur Photographer and Cinematographer," both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods, they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in the event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For all transactions up to £10 a deposit fee of 1/- is charged; on transactions over £10 and under £50 the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, one-half per cent. All deposit matters are dealt with at Dorset House, Stamford Street, London, S.E.1, and cheques and money orders should be made payable to Illife and Sons Ltd.

## CAMERAS AND LENSES

**C**ONTAX f/3.5 Tessar, 1/25th to 1/1,000th, coupled range-finder, perfect condition, ever-ready case, £16; wanted, Stereoscope Viewer, good make, 4, Park Avenue, Sale, Cheshire. [9202]  
**31**×24 Roll Film K.W. Reflex, f/4.5, excellent condition, new case and portrait lens, bargain, £4. Copies, "Amateur Photographer," various dates, 1/9 dozen, post free.—Box 5166, c/o "The Amateur Photographer." [9211]  
**K**ODAK Retina, Xenar f/3.5, Compur 1/300th, purchased new May, 1935, £10/10, also Yellow Filter and Auxiliary Lens, all in perfect condition, £7/10 the lot; will consider reasonable offer or sell separately.—Box 5167, c/o "The Amateur Photographer." [9212]

**T**HREE Cameras, inherited, sale, cheap; particulars, write—68, Hurst Rd., East Molesey. [9233]  
**S**TEREO Camera Versapace, f/4.5, 2 magazines, roll-film holder, 12 slides, uncinator, numerous accessories; list on request, £10.—Box 5237, c/o "The Amateur Photographer." [9237]  
**L**EICA Automatic Focussing Model 2, Elmar f/3.5, perfect condition (unmarked), £17/10; Correx Leica Tank, 15/-; New Ensign la Tropical Carbine, f/4.5 Aldis-Butcher and Compur, £5.—Box 5238, c/o "The Amateur Photographer." [9238]

## WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 213, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.  
 For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

## CAMERAS AND LENSES

**N**EWMAN & GUARDIA Special Folding Reflex, Pentac f/2.9, 3 double slides, F.P.A., filter, lens hood, hide case, £24; Dallmeyer Dallion 12-in. f/5.6 Telephoto Lens, focussing mount, adapter to above, shade, solid pigskin sling case, £8, or the lot £30; deposit system; all in splendid condition.—James, 46, Market St., Manchester. [9234]  
**E**NSIGN 31×24 Focal-plane Roll Film Reflex, f/3.4 Aldis-Butcher anastigmat lens, 1/25th to 1/500th and T. canvas case, Primus sky filter; good condition, £4/10.—Box 5240, c/o "The Amateur Photographer." [9240]  
**A**GFA 4-pl., 9×12 adapted, f/4.5 Solinar anastigmat, delayed-action Compur, 1/200th, double extension, rise, cross front, 3 slides, F.P.A., case; almost new, £5.—Hopwood, 11, Bankhall Rd., Heaton Mersey, Manchester. [9243]  
**Z**EISS Trona 4-pl., Tessar f/4.5, D.A. Compur, double extension, Distar and Proxar lenses, lens hood, F.P.A., 6 slides, leather case, perfect condition, £7; Zeiss Mirax Enlarger £1; Watkins' 4-pl. Tank, 10/6; Justophot Meter, 7/6.—16, Purley Hill, Surrey. [9246]

## MALLINSON'S FREE-LANCING SERVICES

These services comprise:—

● **INDIVIDUAL TUITION IN PHOTOGRAPHIC TECHNIQUE**, clear and practical.

● **COMPLETE TRAINING AND COLLABORATION IN FREE-LANCING**—selection of subjects, how they should be photographed, where they can be sold.

● **42 Fortnightly Lessons**.—News-sheets, personal criticism of members' work, Competition Work, Article Writing, and, incidentally, a 30 per cent rebate off your car insurance premium and free insurance of photographic apparatus up to £30.

"PALS."

This photograph, a typical amateur snapshot, was sent up for criticism and advice by a new Member of Mallinson's Services. Mr. Mallinson was very impressed with its possibilities and advised that with careful handling it would bring in plenty of fees. So far it has earned £22.

Here is a "very ordinary" photograph, a street scene in Tenterden; sharp, clean, but without much interest. This V.P. snapshot was taken by a Mallinson Member. He placed it three times: *Daily Sketch*, *Autocar*, and Postcard rights, all for small fees, but well worth while. This is the kind of sale a comparatively unattractive picture makes.

▼ **No other collaboration in the world is so sincerely individual and genuine.** Old members rejoice at their year-end, and bring in their friends with them.

Mallinson's Services give a fillip to your hobby. They will give you a whole year of happiness. Write for New Prospectus and a copy of "Free-Lance Journalism with a Camera," with 80 illustrations. Post free 3/10, abroad 4/10.

## FIT A ZODEL LENS HOOD

AN  
ASSET  
ALL  
THE  
YEAR  
ROUND

It is not only in the summer that the Zodel lens hood is indispensable. In autumn photography, with the sun at a lower altitude and giving many beautiful shadow patterns and against-the-light effects, a lens hood is even more necessary. Good shots, too, can be obtained on wet days with the aid of a Zodel lens hood—in fact, the scope of your photography is widened considerably during the autumn and winter months. Zodel lens hood is telescopic and folds flat for carrying. It is easily fixed to almost any camera. State size of lens when ordering.

AMAZING VALUE—ONLY  
ORDER YOURS NOW!

7/6

## NEW SUPER IKONTA

Takes 12 exposures on  $3\frac{1}{2} \times 2\frac{1}{2}$  8-exposure Roll Film. Double exposures impossible. Zeiss Ikon latest pattern rotating wedge distance meter, coupled to lens focussing. Rapid Compur shutter. Modern die-cast body. Elegant construction. With f/3.5 Zeiss Tessar lens.

£25 : 5 : 0

Nine monthly payments of 59/-

## FOTH - DERBY CAMERA

Takes 16 pictures on standard V.P. Roll Film. Very light and compact. Fitted with Foth f/3.5 or f/2.5 anastigmat and focal-plane shutter, giving instantaneous exposures from 1/25th to 1/500th sec., also time exposures. Delayed-action movement fitted to the shutter allows the operator to be included in the picture. Fitted with new type view-finder.  
Foth f/3.5 lens £5:5:0  
Foth f/2.5 lens £7:5:0  
Nine monthly payments of 12/3 or 16/11.

## *— The Five Feature Film*

Every good film has some of the following features to recommend it, but in this, the finest all-purpose film on the market, they are all combined.

**SUPER-FINE GRAIN** for flawless, grain-free enlargements from miniature negatives.

**HIGH SPEED** for short exposures in poor lighting conditions.

**PANCHROMATIC EMULSION** for correct rendering of all colours in monochrome.

**DOUBLE COATING** for long-scale gradation and latitude of exposure.

**ANTI-HALATION BACKING** for rendering highlights without "fuzz."

*That is why you should always choose*

THE MOST BEAUTIFUL PAPER EVER PRODUCED

Write for  
GEVALUXE VELOURS  
Leaflet

GEVAERT LTD. - WALMER ROAD - LONDON, W.10

*for Enlargements from  
your holiday negatives*

The surface has the appearance of black velvet, yielding prints of a depth hitherto unknown, with rich luminous shadows and a scale of gradation of extreme range.

Grainless enlargements from even the smallest of negatives.

GEVALUXE gives life and beauty to all types of subject. As simple to use as an ordinary Bromide paper and as suitable for contact as for enlarging work. The results will delight you. If you do not make your own enlargements, stipulate that your Dealer uses GEVALUXE.

(HOLBORN 4780).

(Two minutes from Holborn Tube Station in the direction of Oxford Circus.)

### LEICA BARGAINS AT LOWER PRICES

We are specialists dealing exclusively in miniature cameras such as the Leica. This fact has been appreciated by the photographic public and deals involving miniature cameras now tend automatically to come to us. Our policy of specialization incidentally enables us to buy second-hand apparatus *above* and to sell *below* the market price—a claim which may readily be tested by trial and comparison. Remember, by buying your Leica or Contax from us you will be entitled to very special consideration at any time you may wish to dispose of the camera—either for cash or in part exchange.

Vol. LXXX. No. 2445.

**N**EXT week's issue of *The Amateur Photographer* will be a special Autumn Number. As each season of the year comes round the modern amateur photographer realises the great adaptability, extent and resources of his hobby. The keen worker with the camera has no "close season" nowadays, and as more and more amateurs are taking a greater interest in the production of their own negatives, prints and enlargements, the autumn and winter months can provide even more attractive photographic occupations than the summer-time. In addition to much picture-making outdoors in autumn, work indoors, reaping the harvest of summer exposures, calls for attention. The many phases of this side of photography will be dealt with in our Autumn Number, which will be considerably enlarged and contain many extra pages of reproductions of pictures from the exhibitions now open. Readers should make a note of the date of publication: Wednesday next, September 25th.

### "The A.P." Lantern Slide Competition.

The annual competition organised by this paper for the best lantern slides of the year has again been announced and full particulars, conditions and awards were published in last week's issue, and are repeated elsewhere in this issue. There is a steadily growing revival of interest in lantern slides, and the newer generation of amateurs is realising the attractive qualities of these little transparencies. In this latter capacity they not only test the technical quality of the photograph, but can present the worker's best pictures to an audience in a way that is always appreciated—even

## TOPICS of the Week

AUTUMN EVENING.

*A striking silhouette effect secured in late September.*

more so to-day, as a relief to a display of indifferent ciné work. For this reason, especially as so many small camera negatives are ideal for the purpose, we look forward to a notable entry this year. The conditions will be published again before the close of the competition (October 31st), and in the meantime helpful articles on the subject will appear in our pages.

### Print Quality.

In each succeeding year the prints exhibited at the London Salon of Photography and the Royal Photographic Society's exhibition are better and finer in quality than those in the shows of the preceding year. This is no matter of imagination, but actual fact that has been verified by handling and comparing the prints. It is due to the steady improvement in the printing papers now available, both for amateur and professional use. Bromide—which once held undisputed position as the most popular printing process when enlargements took the place of large contact prints, is now slowly giving way to chloro-bromide and the new Gevaluxe paper. The latter, with its characteristic black velvet surface, is very much in evidence at this year's shows, and of the other pictures on view a large majority are on one or the other of the fine chloro-bromide and lustre bromide papers recently introduced. The result of this is that prints so produced have a rich quality particularly suitable for exhibition work, and the shows as a whole gain in impressiveness and effect.

### A Boom Year.

The papers all say this has been a boom year in photography. That is no mere conventional end-of-

season remark. It is borne out by everybody's observation. Never have we seen so many cameras in the hands of sightseers "doing" the popular places in London. There have been hours every day when the forecourt of the British Museum, the terrace of the National Gallery, and the precincts of the Abbey and St. Paul's have suggested an invasion by a photographic society. The Jubilee, no doubt, gave a good "kick-off" to a glorious summer, but the same thing has been observed in other countries where the influence of the Jubilee could not operate.

### A Slight Disparagement.

Over and over again we notice in modern literature and journalism that when writers want to refer in a slightly derogatory way to certain things they make use of a photographic simile. For example, Mr. Sinclair Lewis, in one of his books, tells us of a bride who, travelling for the first time to her husband's home country, was looking out for the lakes of which she had heard so much, "but when she discovered

them . . . her only impression of them was that they resembled the photographs." Again, a few pages later, he speaks of the fading of the bride's visions "until they were but daguerreotypes in a black walnut cupboard." We read again and again of something that it is "photographic," meaning only that it is over-literal, soulless, inferior. When shall we hear that something is as truthful as a photograph, as capable as a photograph of light and shade, as full of mystery, of delicacy, of transparency? When shall we read that there was about the hero's mind the spaciousness one finds in a photograph?

### Waste.

It was said of the founder of the Colmans that he grew rich not on the mustard that was used but on the mustard that was wasted. The same sort of thing may be true of the manufacturers of photographic material. There is an inevitable waste of material in photography—a waste before the pictorialist gets the picture he cares to send to the

exhibition, before the professional gets the portrait which suits his sitter's caprice, before the Press photographer gets the one print which is "bound to go in." The enormous waste of film in the construction of a cinematograph picture is also common knowledge. But is all this truly waste? A philosophical way to look at it is to regard nothing as wasted if before it goes down the sink or into the waste-paper basket or the dustbin one has learned something from it. The use of film and paper which finds no permanent destination is not unjustified if it has meant a process of trial and error whereby a better result has ultimately been achieved. No doubt much economising could be done in the everyday practice of photography, but there can be no absolute economy. There must be a more generous allowance of cloth than is exactly needed for the coat. The thing to do is to say to the wasted material as it is cast away, what the patriarch of old said to his mysterious antagonist, "I will not let thee go except thou bless me."

## READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with on this page week by week. Other replies appear as usual on the last page.

### Prints for Reproduction.

*What is the best style of print to submit for purposes of half-tone reproduction? Is it possible to make a block from a very rough print?* L. B. (York.)

The order of suitability for easy and effective reproduction has been laid down as follows, but the sequence must not be taken too rigidly. A good print by one of the less suitable processes might well give a better result than an inferior one by a more appropriate process.

(a) A black-tone print on a glossy or semi-glossy paper with a white base. This suggests a bromide or gaslight paper, and these can be obtained in various degrees of contrast (soft, normal, vigorous, extra-vigorous) to suit the character of the negative.

(b) A print on a white base by the carbon or Carbro process, black pigment being selected.

(c) A P.O.P. print of warm black colour, as near black as can be managed by toning. A rather strong and contrasty negative is required, or the high-lights will not be sufficiently clean and bright.

(d) A warm-black cool brown or sepia tone on a glossy or semi-glossy white base. These would generally be made on a paper of the chloro-bromide type.

(e) A print on a dead matt paper, the image being preferably black, or nearly so.

(f) A print of distinctly warm colour, such as red chalk. This is particularly unsuitable when the base is tinted.

(g) A print on a very rough paper, or one with a strongly-marked pattern such as canvas or linen grain. The trouble in this case, whatever the colour of the image, is the actual irregularities of the surface, which no possible form of lighting can altogether eliminate.

It should be remembered that the half-tone process tends to "flatten" the result, so that a print should be rather more contrasty than the pull from the block is desired to be.

As regards your second question this has just been dealt with. At the same time the modern block-maker has many resources, and will often secure surprisingly good results from an unpromising original. When nothing better is available it is always wise to see what can be done even if the print comes very low down on the list given.

### Ciné Film Sizes.

*Taking only the popular ciné film sizes, can you give me the actual "frame" size of each? Are there any data available as to the proportion of film actually occupied by the "frame"?* S. S. N. (Belfast.)

A useful term for the point involved in your second question is "the factor of utilisation," which means the fraction or percentage of the total film area actually occupied by the images. We give the particulars asked for in each case.

With 35-mm. film the frame size is 24×18 mm. and the utilisation factor is 65 per cent.

With the 16-mm. film the frame size is 11×8 mm. and the utilisation factor is 69 per cent.

With the 9.5-mm. film the frame size is 9×6.5 mm. and the utilisation factor is 82 per cent. This higher factor is the result of having central instead of lateral perforations.

With the slit standard film, which is, of course, 17.5 mm. wide, the frame size is 12×9 mm. and the utilisation factor is 65 per cent.

There is an American size of 28 mm. for which the figures are 19.5×14.5 mm. and 68 per cent; and there is also a 17.5-mm. film giving 13.5 and 9.5 mm. and 77 per cent.

# The London Exhibitions

The Annual Exhibitions of the Royal Photographic Society and of the London Salon of Photography were opened to the public on Saturday last, September 14th. Both show marked advances, particularly in the sphere of pictorial work, and everyone interested in photography at its best should endeavour to visit them. The Salon is reviewed on another page.

## THE ROYAL PHOTOGRAPHIC SOCIETY

OF the many and diverse applications of photography, a wide field is covered at the 80th Annual Exhibition of the Royal Photographic Society, which is now open at the house of the Society, at 35, Russell Square, W.C. There are sections devoted to pictorial photography in Rooms 1 and 2; there is also, in Room 1, a wall on which a collection of colour prints is shown; a fine series of natural history subjects is on view in the gallery on the second floor; and the scientific applications of photography in many spheres are to be seen in Room 4. Colour transparencies are displayed in the studio on the ground floor, and, as far as the trade is concerned, many well-known firms are represented in the hall, library and staircase.

### Pictorial Prints.

Naturally, the pictorial section will appeal more specifically to the majority. Just over two hundred prints have been accepted from an entry well in excess of 2,600, and in view of the inevitably severe selection the general standard is very high. Landscape and portraiture are well represented, and, stimulated by the prize offered by Dovel Le Sage, still life is in unusual force. The winner, No. 41, "Window Dressings," by Foster Brigham, Jun., is a good specimen of technical work obviously influenced by the modern advertising school.

Another notable example in the same class is "Morning Glory" (60), by S. Nakagawa, the quality of which is remarkably good, and the feeling for design characteristically Japanese. There are also a number of equally attractive examples, Nos. 64 and 197, "Still Life," by K. Wakasa, and "Water Lily," by J. Regensburg, being worthy of special notice.

In the landscapes Keighley strikes a new note with his forceful "The Cottage in the Grove" (128), and his other print, No. 67, "A Castle of Romance, Segovia," shows a nice feeling for the sunshine of early morning, and is characteristically broad and simple in its treatment. J. Dudley Johnston has a notably attractive expression of evening sunlight in "Naples" (104), and the composition is marked by its suavity of line and adequacy of balance.

Strength of tone—a line of washing in sunshine against a luminous sky—is a feature of G. L. Hawkins' "Monday Morning" (61), and the impression of wind is finely emphasised. Sunshine, again, is the motive of No. 98, "A Place in the Sun," by A. G. Dell, and it is also well expressed in No. 194, "A Sunny Corner," by G. Rigby, where it is decidedly helped by the warm tone of the print. "Shadow" (6), by D. J. T. Bagnall, has a similar theme.

A landscape expressive of great breadth and depth is submitted by J. B. Eaton—"The Valley Farm" (11)—and is one of the few pure landscapes in the show. It is excellent work in a sphere that has been somewhat neglected of late. Other excellent work has been sent by W. L. Shand, W. W. Weir, G. Austen, H. A. Murch, Monte Luke, C. C. Davies, J. H. B. Scott, Walden Hammond, F. R. Fraprie, J. Baird, E. Alenius, Forman Hanna, W. E. Gundill, R. J. Collinson, H. G. Allen, R. Chalmers, J. McKissack, J. G. St. Aubyn, J. Harold Leighton, and the reflections in "In the Harbour of Spalato," by Dr. D. J. Rizicka, are most intriguing.

In portraiture, characterisation at its best is shown by J. Ortiz Echague in "Bebedor Vasco" (142), and Pirie MacDonald's "Portrait" (8) is no less effective in a different way. Marcus Adams is represented by charming child studies, and of the many figure studies No. 59, "It is Interesting," by Z. Kassai, is an outstandingly successful example.

### The Scientific Side.

Work of a very interesting nature is displayed in the section devoted to natural history. There are examples from Whipsnade, and the bird studies are marvellous in the way they depict their subjects so intimately. Most of them are not without a great measure of pictorial appeal, and technically their quality, as a general rule, is supreme.

The colour prints and transparencies show the progress that has been made in this class of work, and the remarkable effects of ultra high speed work—exposures of so fractional a time as 1/100,000th second are exemplified—are not only distinctly curious but educative as well.

Methods of utilising polarised light, by means of the new "Pola" screen, are displayed and are quite effective. Its value in allowing the reproduction of detail and in removing reflections is convincingly demonstrated. Radiology and many examples of the use of photography in medicine, research and industry are also to be seen, and those who are interested in these applications of photography will find much to which to devote their attention. Topographical work is not neglected, and the studies of the *Normandie* will prove an attraction to many. A more extensive review of the Scientific and Technical Sections will be given in a later issue.

### Awards.

The Society's Medal has been awarded to Oliver A. Weiss for his set of stereoscopic transparencies; to J. P. J. Chapman for his 16-mm. Kodacolor Films; and to L. A. Jones for his Kodachrome Film of motion photomicrographs of growing crystals. The Rodman Medal has been awarded to T. C. Dodds for his set of four photomicrographs; the award of £5 5s. placed at the disposal of the Society by Professor Dr. J. W. Morison for the best X-ray photograph has been awarded to G. Lovell Stiles; the Hood Medal has been awarded to E. A. Land for his exhibit illustrating the use of photography by polarised light with Eastman Pola Screens, and, as mentioned above, the Le Sage award of £10 has been awarded to Foster Brigham, Jun., for his still-life photograph.

### Apparatus and Material.

Many recent novelties in apparatus and material are on view. Miniature cameras are a strong feature, as might be expected in view of the way in which their employment has been extended during the past year or so, and, with other specimens of the work of the camera maker, will afford plenty of scope for thought among those who contemplate adding to, or exchanging, their outfit.

The exhibition is open daily from 10 a.m. to 9 p.m., except on Tuesdays and Fridays, when lectures are being given—a list of which appeared in our last week's issue—when it will close at 6 p.m., and the show terminates on the 12th October.

# "How to do it" Photographs

By CLARENCE PONTING.

ONE has only to pick up any daily newspaper, or weekly illustrated journal, to find a series of photographs illustrating the methods used for preparing vegetables, meat and fruits in the kitchen; suggestions for effectively furnishing small rooms; examples depicting the effective arrangement of cut flowers; or the planting of bulbs and plants.

In the more technical journals "How to do it" photographs also figure largely. Weekly journals de-

voted to amateurs' hobbies, such as radio, carpentry, poultry - keeping, gardening, and motoring, etc., also use a large number of such photographs. Even *The Amateur Photographer* has devoted many pages to pictures showing the correct method of using a film camera, developing roll films, etc.

A large number of these pictures are made in studios by professionals, employing skilled models who know how to pose convincingly, and have systems of lighting beyond the reach of the average amateur. There is, however, a demand for this type of work among the hobby journals, which is supplied very largely by amateurs who can photograph and write the necessary descriptive matter which accompanies the pictures.

It is useless to compete with the professional, and equally absurd to attempt to make pictures for the "hobby" Press unless one specialises in one's own particular hobby. I send some of my work to a London Agency, which disposes of my pictures; but as it charges a commission of 50 per cent for placing them, I only send them those which I have not the time to cover personally.

Editors do not always require enlargements for such series photographs. Contrasty glossy bromide contact prints of  $\frac{1}{4}$ -plate size are quite large enough in most cases, for these will generally be reduced when

reproduced. The payment is also rather small, 5s. a print being paid. As, however, these series photographs are easily taken in one's own home, and six is the minimum number used, when one gets a connection quite a profitable side-line can be developed. I always stipulate that the payment is made for one right of reproduction only, which enables me to sell a series several times over to different sources. Expenses can be reduced by making the negatives with a miniature camera or on  $3\frac{1}{4} \times 2\frac{1}{4}$  film. These can be enlarged to  $\frac{1}{4}$ -plate or  $\frac{1}{2}$ -plate, as desired, on a cheap Press paper.

A focussing camera is essential, as most of the subjects have to be taken as "close-ups." A precision miniature camera is admirable, owing to its short-focus lens, which gives a good depth of focus. Editors insist upon this class of photograph being pin-sharp in all planes. A reflex camera is also quite suitable provided that the lens is stopped down sufficiently.

Suitable markets for series photographs can be found by perusing the pages of "The Writer's and Artist's Year Book," obtainable at any bookseller's, or from the journals specialising in hobbies and handicrafts. These

## DON'T EDIT your Holiday Shots until you have a P. P. C.

A job badly done is time and temper wasted—"Editing" in the ordinary manner is, to say the least of it, tedious and tantalising. With this new double purpose apparatus it becomes a simple and pleasurable pastime. The P.P.C. allows you to see your 9.5-mm. films actually in motion without the aid of any artificial illuminant, also you can stop the film exactly when you wish and make necessary cuts and joins.

No Amateur Cinematographer should be without this unique, inexpensive projector, it is so compact you can slip it in your pocket, and no matter where you are you can show your friends those holiday shots you have taken.

journals, if they make use of amateur work, usually state the fact on the Editorial page, something after this manner: "The Editor will be glad to receive photographs and articles for consideration." If this is not stated, it is almost certain that the editor obtains his material through an Agency, or has a staff of photographers who do the work. If, however, one has obtained a good series, it is worth while submitting on the chance that they may prove acceptable. A stamped addressed envelope will ensure the return of the prints.

## A Focussing Scale for the Reflex

By W. R. LEE.

TO those who can run to one camera only, the reflex type is perhaps the best, but, useful as it is, there are times when the necessity to open the hood and focus is a real handicap, as also is the relatively low viewpoint obtained with the reflex compared to others working from eye-level. What is known as the "Press" type camera also has many advantages and overcomes the low viewpoint trouble, but lacks the convenience and ease with which a reflex can be focussed. Luckily, it is easily possible to combine the good points of both types by the simple means of adding a focussing scale and direct-vision view-finder to the reflex.

To be accurate, the scale markings should be clear and as well spaced as possible. Reference to Fig. 1 will show that this has been done by screwing a curved pointer into the side of the standard focussing knob. The tip of the pointer is  $1\frac{1}{4}$  inches from the centre of the knob and the arc drawn on the scale plate is of  $1\frac{1}{8}$  in. radius.

The scale plate itself is made from a piece of thin sheet zinc and is attached to the camera by two screws and the bottom grip of the handle. The arc is drawn first and the various settings added as found by tests. This is done with black Indian ink and the whole plate finally coated with transparent varnish to protect the markings.

When marking out the scale erect the

camera on a tripod, use full aperture, and measure the distance from the object focussed on to the back screen of the camera, not the lens. Focus on something with bold lettering.

What actual distances are marked out, is, of course, largely a personal matter, and quite immaterial so long as they are clear and unmistakable. The value of this scheme lies in the fact that one can have one's own favourite working distances set out.

The camera illustrated, a Thornton-Pickard, is marked 3, 4, 5, 7, 10, 12, and then an arrow. These figures merely indicate the required number of *my paces* for various distances,

Fig. 1. A sheet of thin zinc and a pointer is all that is needed.

Fig. 2. Showing the scale in position and the eye-level finder on top.

and the arrow is the infinity mark.

Apart from the handiness of having a scale to focus by, the frame type of direct-vision view-finder is alone well worth having, as many a subject is hard to pick up on a screen and register on the plate even though there has been ample time to focus with the hood in the ordinary way. I find my scale of great assistance for sports subjects.

If the rise and fall movement of the front has been used, do not forget to allow for this in the finder.

## SEPIA TONING FOR GASLIGHT PRINTS

THE main advantage of this method lies in the fact that the developing and toning are carried out in one operation.

The developer is prepared by adding approximately one part of 10 per cent alum solution to six parts of standard M.Q. developer.

The addition of more alum results in a lighter tone, but development time is increased. Less alum gives a blacker print with a decreased development time.

The print should be fully exposed and the time of development greater than normal, but fixing remains the same as for a straight print. The following example, which yielded excellent results, will serve as a rough guide. After an expo-

sure of eight seconds (usually six or seven) the print was developed for three and a half minutes instead of the usual one minute and then left in the fixing bath for about ten minutes, after which it was washed very thoroughly. An acid fixing bath is desirable, but not necessary, since it tends to minimise the risk of staining.

Since so many photographers use their own favourite developer, and the writer has been unable to check the action of the alum on all these formulæ, no definite working instructions can be given. In conclusion, the writer would like to say that he has secured excellent results, and feels that a trial will reveal to most people the possibilities of this method.

L. R. T.

# Nature Photo

The Section devoted to Natural History Photography at the Royal Photographic Society's Exhibition will direct the attention of many readers to this attractive form of Camera Work. In the article on this page a well-known exhibitor gives some practical hints and tips on the subject.

carefully screened with bracken, heather or other foliage. It may be moved up gradually to within working distance, which is usually from eight to twelve feet. An initial attempt should not be made on a rare bird or a bird with eggs, as it may cause desertion of the nest.

The size of the hide is less important than any movement or noise in the structure. Fabric must not flap in a breeze. Birds are often suspicious of the staring, eye-like lens, even when quite used to the hide. A lens hood yields brighter negatives and prevents fabric or foliage from blowing in front of the lens. A dummy lens and hood contrived from a bottle of suitable size and a cardboard tube to fit may be left in position. It is advantageous to be accompanied to the hide by a friend, who departs from the vicinity when the operator is ready to make his exposures.

Animals, unlike birds, are warned of danger by scent. A close approach is impossible unless the wind is blowing from the animal towards the stalker. The camera shutter can be operated by the magnets and bar from an old electric bell. It is then only necessary to conceal the relatively small bulk of the camera, the photographer occupying a more distant position from which he can see clearly and yet remain concealed. This method of remote control is the basis of high-speed flashlight

Left : The Green Woodpecker listens.  $1/5$ th sec.,  $f/11$ , Ilford S.G. pan. plate.

Below : Oyster Catcher, walking to nest on shingle.  $1/20$ th sec.,  $f/16$ , Imperial S.S. plate.

**W**HENEVER photographs of wild animals and birds are displayed to friends, it is safe to forecast that someone will remark: "How did you get close enough to take those?"

The answer is, of course, the purpose of this brief article.

The most suitable apparatus is largely a matter of experiment and personal choice, but a quarter-plate field camera with a swing back, a rigid tripod, a good lens of six to eight inches in focal length, and a focussing magnifier, can produce excellent results. The shutter used must be reasonably silent in operation. The lens does not need to have a large aperture, as to obtain a good depth of definition a stop of  $f/11$  is often advisable when the light permits.

Most wild creatures appear to ignore objects with which they are familiar. Where suitable natural cover is not available it becomes necessary to erect a "hide" which harmonises as closely as possible with its surroundings. This screen may be built of light branches and fabric to resemble a small tent, and then be

The Brown Rat caught stalking.  $1/100$ th sec.,  $f/8$ , Imperial pan. plate. Flashlight : 80 grains flashpowder at six feet.

# tography

By L. J. LANGFORD.

photography. The extremes are joined by a length of twin flexible cable, a small electric battery is placed in circuit, and a bell-push enables contact to be made instantly. The badger was obtained in this way, the flash and shutter being synchronised at  $1/100$ th of a second. A variation of this method is to allow the animal to make the contact by touching a fine wire or bramble placed across its path. The rat was taken in this way.

## Technical Points.

Many workers prefer plates to films, and in that case a changing-bag is an asset. When the light is good a plate of medium speed gives a better scale of gradation. Faster plates may be used when the lighting conditions are not so favourable, or when high shutter speeds are required. Exposure should always be as full as possible. The rook (see illustration) had a quarter of a second at noon on a bright April day, the lens being at  $f/8$  and the plate 500 H. & D. As the scale of the image in the negative is comparatively small, careful focussing is imperative.

The choice of a developer is also important. Borax M.Q. gives a remarkably fine grain, full detail in the shadows, and a softness in the high-lights, advantages which are fully appreciated when enlargements to three or four diameters are made. In this work it is essential, if it is to be considered seriously, that technical excellence is aimed at before pictorial quality. At the same time there is no reason why careful attention should not be devoted to suitable arrangement of the subject and its surroundings in an endeavour to make a good composition, particularly as "after-work" on the print is taboo in nature photography. It

*The Grass Snake. 2 secs.,  $f/22$ , Wellington Anti-Screen.*

will be seen at the shows where the best natural history photographs are on view that many are fine pictures as well as reliable records.

It may interest many readers to know that an exhibition of nature photographs will be on view in the Whale Hall of the British Museum from the middle of October

*"Good Evening, Everybody!" Badger leaving sett at late evening.  $1/100$ th sec.,  $f/8$ , Imperial S.G. pan. plate. 130 grains of flashpowder at nine feet.*

*Rook in nest at tree top.  $\frac{1}{2}$  sec.,  $f/8$ , 500 H. & D. plate.*

to the end of November. The exhibition is being arranged by *Country Life*, with the assistance of the Zoological Photographic Club and other interested bodies, and it is expected that the work shown will include all the best nature photographs of all the most interesting phases of animal life from overseas.

# The LONDON SALON of PHOTOGRAPHY

The Twenty-sixth Annual Exhibition of the London Salon of Photography is now open at the Galleries of the Royal Society of Painters in Water Colours, 5a, Pall Mall East, London, S.W.1, and well maintains its standard as the premier international pictorial show in the photographic world.

EVERYONE who is interested in the art of photography, amateur or professional, will find in the London Salon of Photography much to admire, much that is stimulating, and, possibly, something that is so far removed from preconceived ideas of its possibilities that it may come as a shock and seem to invite a certain amount of criticism. Examples such as these will, nevertheless, be found to provide their own justification, for the Salon welcomes new and original phases of pictorial work, and, on contemplation, their educative value and the function they serve in suggesting fresh fields for endeavour are both inspiring and provocative of thought.

## Drastic Elimination.

The show is fully representative of pictorial photography of to-day. All of the modern schools are in evidence; the older and traditional class of work maintains its position; and examples combining the best of both forms are to be found. This is not surprising, having regard to the fact that, out of an entry of between 4,000 and 5,000 from all parts of the world, it is only possible to find a place for 400 or so, and, in view of the drastic elimination that has to be practised, the survivors must and do reach a very high standard indeed. Entries, both from home and abroad, were in excess of previous years, and practically every country is represented.

Quality, whether viewed from the pictorial or technical standpoint, is a feature of the show. The exhibition as a whole will strike the visitor as a sparkling display of magnificent prints that would make the shows of a few years ago dull in comparison. The modern printing processes employed have something to do with this.

Something noteworthy is to be found in each exhibit, and particularly is this to be observed in the work of the members of the Salon, which will be dealt with first. The child studies of Marcus Adams, for example, are outstanding, not only in artistic characterisation, but in print craftsmanship as well.

The richness and depth of photogravure is to be seen in its most attractive guise in several examples

from the hand of J. H. Anderson. The subjects themselves are, as usual, perfect in selection and treatment.

G. L. A. Blair sends a number of his breezy shipping subjects. This year he has been fortunate in capturing some good studies of "wind-jammers." An impression of sunshine is, on the other hand, a feature of the large and impressive carbon prints by Alexander Keighley, and this is enhanced, in no small measure, by the romantic associations of the literary content.

## Notable Work.

Somewhat akin in nature, but treated in his own individual way, are the series of subjects submitted by James McKissack. All of his prints are notable examples, and, besides their highly picturesque character, they are also remarkable for their imaginative quality. Dr. E. G. Boon again this year exploits the latent possibilities of groups of common articles—mostly drawn from Italian market stalls—in still-life studies of most uncommon attraction. Their originality is pronounced, and they bear favourable comparison with the Japanese and German work in this school of picture-making.

The tiny gum prints by J. Harold Leighton are gems of their kind, and the beauty of the prints is only exceeded by their pictorial appeal. Nowadays, there are few workers in this particular process, which is a pity, for it has a quality of its own, and, developed to its full extent, it is capable, as these examples show, of providing prints of exquisite texture and almost unlimited range.

Similar in general appearance are the very dainty bromoil transfers by A. F. Kales. His treatment of the nude is very charming, and the grainy texture of the prints conveys something of the idea of a charcoal sketch. That the same process is capable of great richness and a full range of tone is demonstrated by the fine series of prints from C. J. Symes, in which these qualities are exploited to the full. Their size is very impressive, and the subjects, all of which deal with sunshine as the motive, are very diverse in character.

G. L. Hawkins contributes a number of striking landscape subjects, also of commanding size, and their appeal, particularly in view of the neglect to which this class of work has been subjected in recent years, is decidedly high. His handling of trees against a setting of beautifully clouded skies is clever and most effective.

That veteran worker Walter Clutterbuck is represented by some characteristic gum prints. J. M. Whitehead submits a landscape of no little charm—"The New Moon"—in which an evening effect is very tenderly and sympathetically treated. Harold Cazneaux also sends some of his most interesting work, and Angus Basil is well represented.

A character study of great virility comes from the hands of J. Ortiz Echague, and Pirie MacDonald has a distinctive study of a male sitter. Both examples are representative of portraiture at its best, and, in the same class, the work of Herbert Lambert is not only striking, but exceedingly individual and powerful. His impression of "Cortot" is worthy of special notice, for besides its able expression of character, its arrangement is on extraordinarily novel lines. Leonard Misonne has a number of his attractive bromoils on view, and the nudes from Bertram Park are well designed and most engaging.

The series of masterly sea studies by F. J. Mortimer are highly imaginative and impressive, and besides two distinctive renderings of the guns of battleships, he also shows a powerful impression of a breaking wave as well as a highly individual study of the forepart of a yacht. The whole set is very strong and vivid, and, even in the company they are, their attraction is outstanding. J. A. Lomax has a number of very pleasing studies of various effects of sunshine, in which it is interesting to note the very able use of scanty and unusual material.

A further review dealing with other British, American and Continental work on view will appear in a later issue, but in the meantime every reader should endeavour to pay a visit to the show, which remains open daily from 10 a.m. to 6 p.m., until Saturday, October 12th.

# COME TO CITY SALE AND EXCHANGE

—YOUR ORDINARY CAMERA FOR A

# Rolleiflex

We will make you a very generous part-exchange allowance and, moreover, you will have a camera which will enable you to "carry on the good work" all the year round. Rolleiflex combines the advantages of the finest modern reflex and roll-film cameras. Its pictures are equal to the highest reflex quality, and these are obtained with the cheapness and convenience of roll films. Rolleiflex takes 12 pictures on  $3\frac{1}{2} \times 2\frac{1}{4}$  8-exposure roll film for 1/-. The square pictures are a great advantage as they can be enlarged or trimmed to any required shape. Rolleiflex shows your picture full size and right way up, and focussing, shutter speed and lens stop can be seen all the time.

Fitted with one-lever Compur shutter speeded to 1/500th sec., T. and B., and F/3.5 Zeiss Tessar lens. It will enable you to get perfect pictures in all kinds of light and weather conditions..... £22 10 0

# how I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CCXCIX.

Mr.

F. G. JAMES.

From information communicated to our Special Representative.

"I BELIEVE that in one particular I can claim to be unique among the contributors to this series. I was driven to photography by Fear. So acrimonious was the condemnation of my work by the chemist who did my D. and P. work, some years ago, that I became frightened of giving him any more to do, and started to develop my roll films in the coal cellar. The first two reels were fogged; and whilst developing the third by the 'see-saw' method, I managed to knock from a nail in the wall the red cycle lamp I was using for illumination. It fell into the developer and the oil from it gave me a charming mosaic result. Thus, finding roll films to be too difficult of manipulation, I took to plates and a T.-P. reflex and started photography in earnest.

"For several years professional studies prevented my joining a photographic society, and during that time I derived my photographic training from the columns of *The Amateur Photographer*. I worked through the Beginners' and Intermediate into the Advanced Workers' section of the monthly competitions.

"Naturally, my technical methods do not differ fundamentally from those of many of the other contributors to this series, but, like them, I have a few personal prejudices and processes.

"Panchromatic plates used, as necessity demands, with or without a filter, are developed, usually in a tank, but occasionally in a dish after desensitising. Then 10×12 in. or 15×12 in. enlargements are made on a suitable grade of bromide or

chloro-bromide paper, and I endeavour so to compound my M.Q. developer as to give warm-black tones on the bromide. I consider that a good bromide print can compare favourably with a print by any other process, but I fear that with some inexperienced workers too little care with the exposure, and the temperature and time of development, yields results that offer wide scope for condemnation of the process.

"As I use a vertical enlarger of limited extension I sometimes find it desirable to make an enlarged negative when enlarging from a small part of the original negative.

"I am interested in record as well as pictorial work, for, in wandering with my camera in search of pictures, I have developed great interest in Mediæval and Renaissance architecture. This obviously influences my pictorial work, and, in the future, may do so still more; but any subject with an attractive sunshine effect has an irresistible appeal to me. The power of photographic artistry lies in tonal massing, and the sun, with its complementary shadows, creates ideal subject matter for the pictorialist. Personally, I think that a photograph without sunshine is as featureless as a flower garden without flowers.

"My ideal picture is one that will give me complete satisfaction; and when I achieve this ambition I shall know that my allotted span is drawing to its close, for my success will be due, not to the triumph of my pictorialism, but to the decay of my critical faculties."

(A further example of Mr. James' work is reproduced on one of the centre Art pages.)

VESPERTINE.

F. G. James.

# Pictorial Analysis

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"CENTRAL PARK LAKE," by Edward Alenius.

IT is not without interest to observe that, modern as the nature of this subject may be, it has been treated, as far as the composition is concerned, on the soundest of traditional lines, and, in consequence, not only is the mood of the picture finely and adequately expressed, but it attains its end without straining after effect, and without any of the forced eccentricity affected by the more advanced school.

The mood—or the effect that supplies the pictorial content—is the transformation that the presence of atmospheric mist creates. Under such conditions, only the foreground can display anything in the nature of detailed gradation, the more distant planes being shorn of all but the most pronounced differences in value, and, for all practical purposes, being shown in what might be described as flat washes of even tone. Besides the natural beauty of effect, which is not inconsiderable, such a state of affairs inclines towards simplicity of rendering and is of service in making the task of satisfactorily arranging the composition much easier.

The foreground, here, consists of fairly strong contrasts of tone. The shapes of the masses are good, and, though there is plenty to lend an appropriate degree of interest to this part of the picture, the main attraction lies in the impressive and dignified forms of the buildings dimly discernible in the distance.

Of these, the chief is the tower (1). It attains its primary significance on account of its height, in which it has the ascendancy, and through its position in the picture space. Its importance is enhanced, too, by the way the buildings on each side lead up to it. On the left, there is a small tower, then a drop in the skyline, another tower, a further drop, and then the main spire towers towards the top. On the other side, there is a similar gradually ascending succession of masses, and the joint effect of the

two is to stress the point to which they ultimately ascend.

To some extent, the distinctions in the tone values of the sky, which, by the way, lend a touch of luminosity that adds immensely to the æsthetic impression, help to throw the tower into prominence; but, on the other hand, the internal contrasts, which are usually employed to emphasise the

exceedingly forceful, but, inevitably, is accompanied by a suggestion of formality. Such a suggestion, as a rule, should be avoided in composing landscape subjects on account of the fact that it is foreign to their character; but, in a case like this, the objection is scarcely applicable, for the nature of the architecture itself tends towards a certain symmetry of form, and formality stresses this particular characteristic. So that, not only is the selection of the central placing justified by the emphasis it confers upon the tower as the centre of interest, but it is also vindicated by its suitability to the nature of the subject.

Moreover, it tends to help the expression of the qualities of dignity and height, and, inasmuch, to advance the pictorial value of the impression.

In this instance, therefore, its effect is beneficial, but it does not extend so far as to invite any real suggestion of symmetry, for the tower is not exactly in the centre, the masses on each of the two sides are different, and the placing of the bridge in the foreground well over to the left further inclines towards a countering of the suggestion.

This is as well, for a truly symmetrical arrangement would be as distasteful as over-exaggeration in any other aspect, but symmetry and formality are not precisely the same, and the distinction makes all the difference.

It might also be mentioned that, with the main interest in the distance instead of in the foreground, the added emphasis is necessary to maintain its supremacy over the stronger tones and contrasts of the latter. On the other hand, the contrasts in question divide the masses of the foreground into smaller elements and reduce their pull in comparison with the more uniform massing and greater scale of the distance, so that, on the balance, the interest remains where it is intended to be. "MENTOR."

dominance of the centre of interest are, in the nature of things, not available. The mist prevents their appearance, and it is for this reason that the adoption of the strength of the pyramidal form—created by the gradual ascension of masses on each side—is particularly well chosen, for its strength takes the place of the power of attraction that contrast usually provides.

It will be noticed, again, that the tower is placed very near the vertical centre. This, contrary to an opinion that is sometimes expressed, is

## SOME CRITICAL COMMENTS on the *Beginners'* prints reproduced on the opposite page

**M**OST of the troubles that beset the amateur portraitist, and their number is not inconsiderable, would be avoided by the simple expedient of adopting a viewpoint appreciably more distant than is usually employed. In these days of small cameras and automatic enlargers the smaller scale is more or less immaterial, and, whenever the negative contains more than is actually needed, it is a simple matter to arrange for the exclusion of those parts that are not required.

### **The Point of View.**

The choice of this expedient is an aid in avoiding the apparent distortion that arises from the employment of the comparatively short focus lenses that are fitted to the majority of cameras in common use. Their field of view is very much more than that of the eye, and when a subject is too nearly approached, there is an appearance of an exaggerated perspective that is highly displeasing.

The more distant viewpoint, too, is of service in lessening the chances of incorrect focussing; in minimising the possibilities of subject movement; and is, not infrequently, a device that obviates some of the difficulties of avoiding camera-consciousness.

No. 1 of the prints reproduced on the opposite page—"High Tide," by A. T. Grubb—is an excellent child study, and the fact that a side view has been chosen lessens any suggestion of distortion that might otherwise have arisen.

As far as pose and lighting are concerned, there is little to criticise, and the mood and character of the little figure have been well brought out. The image, however, is not quite as well focussed as it might be. The outlines of the figure are slightly diffused; the distance is more so, and the grass at the very base is sharper than anything else.

### **Diffusion of Image.**

The outlines of the child should, of course, be well defined. The background may be diffused, and, though it is inadvisable for any blurring of the image to be apparent in the immediate foreground, a very slight degree might be tolerated if the figure is perfectly sharp.

The amount by which the distance between lens and the sensitive surface of the plate or film requires to be reduced to bring the figure into exact focus is slight, and, if there is any difficulty about judging distances or in being dead certain about the focussing on a screen, that difficulty is decreased by the adoption of a viewpoint farther away. Other things being equal, the greater the distance from lens to sitter the greater is the depth of focus, and, had a viewpoint some two or three yards farther off been adopted in this case, and a similar misjudgment had occurred, it would, for all practical purposes, be undetectable.

In No. 2, "Hallo, Daddy," by Charles T. Baker, the subject is no less pleasing, and, indeed, is beautifully caught. The effect of sunshine, too, is delightful, and the print conveys the impression of a jolly little infant in an engaging mood; *but* the outstretched foot is apparently quite out of proportion, and might belong to a child twice the age.

Such distortion is undoubtedly a definite drawback, and here, again, the choice of a more distant viewpoint would have prevented its appearance.

### **Distortion a Danger.**

A low viewpoint, combined with a standpoint that is too near, is responsible for the suggestion of "middle-aged spread" that characterises No. 5, "Diana," by A. J. Behn.

It is an obvious exaggeration. However useful any deviation from the normal viewpoint level may be in other classes of work, in portraiture it is bound to introduce a suggestion of abnormality. This should obviously be avoided, for it is not only bound to be displeasing to the sitter, but is also highly distasteful in itself. It is a pity, too, for, as far as the features are concerned, they are nicely rendered and the expression is charming.

A better degree of judgment is to be seen in No. 4, "Sunny Days," by H. W. Buxton. Here, there is not the slightest hint of distortion, and, as it stands, the print makes a very successful portrait. Besides this, it conveys a nice feeling of sunniness and the open air, and, if desired, it would be quite feasible to enlarge the

head and shoulders to any reasonable extent.

### **Setting and Subject.**

In Nos. 3 and 7, "Sunday Afternoon," by R. A. Flett, and "Child Study," by T. Edwards, another form of drawback is encountered in the choice of a setting. In each case, it is inclined to be over-assertive and to diminish the attention that ought to be devoted to the subject proper.

Comparison with the examples previously discussed shows the advantage of a simple background, which, in showing up the figure and refraining from drawing attention to itself, serves its function admirably. The lights and darks of the setting in No. 3 are most distracting, and the fault is heightened by the excess of contrast throughout.

Some improvement, no doubt, could be obtained by the substitution of a softer type of paper for that employed, but it would be far better if, in the first instance, a background of more even tone had been selected. No. 7 does not exhibit the same violence of tone, and, technically, it does not offer much ground for complaint, but the texture of the wall makes too insistent a setting and it does not need much in the way of ingenuity to improvise a better.

### **Landscape and Figures.**

The idea is entirely different in the case of No. 6, "By Derwentwater," by Miss R. M. Bradley, for the intention, evidently, is to show the figure in action, in a landscape setting. It is not so much a portrait as the others are, but a figure study, and both figure and setting are integral features.

It is true that both the figure and the swans are shown on rather too large a scale, so much so that they are inclined to dwarf the landscape; but, apart from this, the two combine very well and make a most successful composition. Possibly, a measure of over-anxiety to make the most of the figures was responsible for their over-assertive size, and, in this case also, a slightly more distant viewpoint is indicated as an effective remedy. It is evident even from these examples that distance is an important factor.

"MENTOR."

# With the Beginners

NOTES AND NOTIONS FOR THE  
LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

## CAMERA LIMITATIONS.—IV.

I MAKE no apology for continuing the consideration of the limitations imposed by cheap and simple cameras, because it is a subject in which so many beginners are interested, for the simple reason that their own apparatus is far from the ideal. Next week the discussion of this matter will have to be suspended, as the issue will be a special Autumn Number; but I shall not forget my promise to sum up the whole question point by point; and I shall be very disappointed if I do not convince the beginner with even the simplest of apparatus that he is not by any means so "cribbed, cabined and confined" as he imagined.

It may surprise some beginners if I state most emphatically that expensive and elaborate apparatus may be a serious handicap to them; but it is a well-known fact that those who have got along quite well with a fixed-focus box camera begin to make all sorts of blunders and failures directly they come into possession of a camera which they fondly believed would raise the standard of their work enormously. They believed that it was to be roses, roses all the way, and were surprised to find that there were more thorns than flowers.

This, of course, is not the fault of the apparatus, but of their lack of knowledge and experience in using it.

But now I am going a step farther, probably to the increased surprise of the beginner; and I have made the

three snapshots of a kitten to illustrate one point as an example of my contention. And this contention is that the high-class and expensive apparatus after which the beginner hankers does not remove all difficulties. In fact it sometimes increases them.

Now suppose our friends with a camera fitted with an  $f/8$  or  $f/11$  lens, and a two- or three-speed shutter, wanted

Fig. 2.

Fig. 1.

to photograph this kitten. It looks a pretty meek and mild little beast, but you may take it from me that it is nothing of the sort. It was moving about in the rough grass, with an occasional pause, but on the whole giving the impression that it was in at least two different places at the same time.

With a non-focussing lens it would be possible to photograph it only at and beyond a certain distance, and the image would necessarily be a small one, and would need considerable subsequent enlargement. But the kitten and its surroundings would be sharp.

If the camera had a focussing scale it would not help matters. The kitten might be, for example, six feet away; but by the time the scale was set to that distance, and the lens

September 18th, 1935

pointed at the kitten it would be discovered that there was no kitten there to point at, but that the innocent-looking face was somewhere about the horizon.

The beginner who knows something about such problems comes to the conclusion that he could do the job easily, if he had the right camera. He visualises a quarter-plate reflex, with a fine 8-in. lens to give a good-sized image, an  $f/4.5$  aperture to secure ample exposure with the necessary shutter speed of  $1/60$ th of a second, and a full-sized image that could be kept sharp at all distances of the mobile subject. Then he could snap at just the right moment.

Well, that is exactly the apparatus I used. Look at Fig. 1. The lens (at  $f/5.6$ ) gives only very shallow depth of definition. Along one narrow strip the rough grass is sharp; before and behind that strip it is excessively fuzzy. The only part of the kitten that is sharp is that which comes within the strip.

In Fig. 2 there is the same shallow depth, but the kitten, being broadside-on within it, is more generally sharp.

In Fig. 3 the animal is moving towards the camera. Now it is all very well to talk about keeping the definition sharp at all times on the moving object, and firing the shutter at the right moment. In practice it does not work. There is the "lag" of the shutter to take into account. There is an appreciable time between pressing the trigger and the working of the blind.

The exposure has to be "anticipated" by a fraction of a second. In Fig. 3 the foreground grass shows the point of focus, and the "anticipation" has been overdone. The kitten has not quite reached the sharp plane. Consequently it is not sharp anywhere. This was my fault. But even an experienced worker might make the same mistake in the same circumstances.

W. L. F. W.

Fig. 3.

# PHOTOGRAPHY CLASSES

We are indebted to Mr. C. L. Curtis, of Sydenham, for the compilation of the following list of instructional evening classes for photography now available in the London area. These are in addition to the classes at the various polytechnics to which reference has already been made in "The A.P." It should be noted that women students are eligible to join the classes in the literary Institutes. In every case prospectuses and any further information can be obtained from the Heads of the Institutes. The duration of the sessions is from September, 1935 to June, 1936.

## LITERARY INSTITUTES.

Putney Literary Institute, County Secondary School, West Hill, S.W.15. Photography. Wednesdays, 7.45–9.45.

## MEN'S INSTITUTES.

Battersea Men's Institute, Latchmere Road, Lavender Hill, S.W.11. Photography. Tuesdays, 8–10; Wednesdays, 8–10.

And at Warple Way School, Wandsworth, S.W.18. Photography. Tuesdays, 8–10.

Bermondsey Men's Institute, The Alma School, Southwark Park Road, S.E.16 (classes meet at Galleywall Road School, Rotherhithe New Road, S.E.16). Photography. Tuesdays, 8–10; Thursdays, 8–10.

Bethnal Green Men's Institute, 229, Bethnal Green Road, E.2. Photography. Wednesdays, 8–10; Fridays, 8–10.

Deptford Men's Institute, Clyde Street School, S.E.8. Photography. Fridays, 8–10.

Downham Men's Institute, Durham Hill School, Downham Estate, Bromley, Kent. Photography. Tuesdays, 8–10.

Kentish Town Men's Institute, Holmes Road, Kentish Town Road, N.W.5. Photography. Wednesdays, 8–10.

North Kensington Men's Institute, Bevington Road School, Portobello Road, W.10. Photography. Tuesdays, 7.45–9.45.

North Southwark Men's Institute, Orange Street School, Union Street, S.E.1. Photography. Wednesdays, 8–10.

Poplar Men's Institute, The Hay Currie School, Byron Street, E.14. Photography. Tuesdays, 8–10; Fridays, 8–10.

Stepney Men's Institute, The Raleigh School, Ocean Street, E.1. Photography. Thursdays, 7.30–9.30.

Walworth Men's Institute, The John Ruskin School, Beresford Street, S.E.5. Photography. Tuesdays, 8–10; Fridays, 8–10.

Woolwich, Vicarage Road School (apply to the Head of Powis Street Evening Institute, S.E.18). Photography. Mondays, 7.45–9.45.

Enrolment for all the classes indicated above takes place in the week beginning 16th September, 1935.

Instruction will commence in the week beginning 23rd September, 1935.

Fees, students living in the Administrative County of London:—

Literary Institutes (except Goldsmiths' College), one class per session, 7s. 6d.; each additional class, 4s. 6d.

Goldsmiths' College, one class per session, 10s. od.; any number of classes, £1;

Men's Institutes, any classes, per term, 1s. 3d. (there are three terms in the session).

Students living outside the Administrative County of London may, in many cases, be admitted at the ordinary London fee. Particulars may be obtained from the Head of Institute.

# Picture Points

## for Beginners, by RICARDO

### Night Photography

NOW that the evenings are drawing in and they are not yet too cold for night photography, a few words on this interesting subject will be seasonable.

Judging from beginners' prints of outdoor night subjects it seems that the lights themselves are usually the chief attraction and the "reason why" of the pictures. This is a big mistake, as will be seen.

With night photography, the novice must first appreciate that where artificial lighting is composed of points of light, and cannot be compared with widespread daylight, one must necessarily concentrate more

on the placing of the dark masses to provide interest in the picture. Points of light cannot provide the same good modelling given by daylight, but they can be made to reveal interesting contours or "shapes" of masses. This is shown in the first sketch.

As with all other branches of pictorial photography there should be one main point of interest, and once this is found it remains for the photographer to place the camera to the best advantage. This

is not always so easy to do, as the lamps are fixed. If the lights are photographed for themselves, they are generally much too spotty and irritating to be pleasing. A typical example of this fault is to be seen in the second sketch.

### "Falling out" of the Picture Space

EVERY beginner should try and make the subject matter "self-contained" within the four sides of the print. By this is meant that once the interest is attracted it should not be allowed or induced to wander out of the picture.

This is one of the first elements to be learnt about picture-making, but is, however, much too wide a subject to deal with in a few lines, since it depends on so many factors and can best be explained by dealing with singular points.

If we examine the sketch below we can see how weak the composition can be if we have the subject matter sloping away at the sides. No matter how strong the *motif* may be,

the effect is materially weakened by such an arrangement. Whenever possible this can be avoided by choosing a viewpoint where the subject matter slopes away from the sides towards the centre instead. The effect gained can be seen in

the top sketch. The eye is induced to travel round the sides towards the centre instead of away from it, as in the second picture.

This is one of the reasons why a dark foreground is so helpful at the foot of the print. While it helps to provide a "door-step" into the picture, it also is a check against the interest being allowed to wander out.

At the same time it provides a natural base of tone for the composition that would not be achieved if the foreground were the lightest part of the print.

### 45° Lighting and the Use of Reflectors

IN last week's series, we discussed the use and advantages of 45 degrees or three-quarter front lighting. We saw also how it gave better modelling for solid subjects than top, front or side lightings.

It is seldom desirable, however, for such subjects to have only one source of lighting, whether artificial or daylight, and another illuminant directed from another angle is essential to provide realistic modelling, and to reveal the shadow contour.

If the four spheres in the first sketch are examined we can appreciate the use of this secondary lighting from the back. This can take the form of reflectors as well as lamps, and in most cases it is to be preferred, for various reasons.

This back lighting should never project a light of intensity equal to the main lamp, but be just sufficient to relieve the shadow side as shown. A reflector of a mirror, white cloth or paper is ideal and is more convenient to use.

In the second sketch we can see how this reflector was placed behind the sphere. It has no fixed position for, as the dotted lines show, it needs to be tried at all angles to suit the subject. The next diagram puts the principle into practice. A person is now seen in place of the sphere and a suggested arrangement of light, in this instance a window, and reflector. The sitter can, of course, look either way.

# NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

The second half of the Annual Exhibition by members of the Professional Photographers' Association was opened yesterday, September 17th, by Priscilla, Countess Annesley, at Princes Galleries, Piccadilly. This half of the exhibition is devoted entirely to portraiture by British professionals, and remains open until September 28th. A notice of the pictures will appear in our next issue.

At the private view of the Royal Photographic Society's Exhibition on Friday last the George E. Brown Memorial Panel was unveiled by Mr. A. J. Bull, after the formal opening of the exhibition. We have already published a photograph of this panel, which has been executed in bronze by Mr. George Hawkins. A balance sheet of the G.E.B. fund has been published showing that £568 6s. 1d. has been contributed. This amount, less the cost of the bronze panel, has been paid to the widow of the late George E. Brown.

The Pathéscope 9.5-mm. Super Gazette for September includes many items of outstanding interest forming an excellent record of major events of recent weeks. The subjects are as follows: "Aldershot Army Review," "H.M. Leads the Fleet," "The Prince in Jersey," "New Car Records" (Cobb), "Spithead Naval Review," "Latest in Aircraft," "Old Style Rail Travel," "Cowes Regatta Week," "Children's Day, Tidworth Tattoo." To meet the numerous requests which the firm has received for a special film on the Royal Naval Review at Spithead, they are also issuing a 60-ft. reel of this subject. The film has only one title (unnotched) and provides a comprehensive presentation of the inspection carried out by His Majesty. Supplies of this 60-ft.

reel, entitled "Naval Review at Spithead," are now available at the special price of 7s. 6d. per copy. Application should be made to Pathéscope, Ltd., 10, Great Marlborough St., W.1.

Commencing on October 1st, photographic classes will meet at the Walworth Men's Institute, Beresford Street, Walworth, S.E., at 8 p.m., every Tuesday and Friday. The instructor is Mr. W. Alan Wilson, and the fees are merely nominal. Lectures and demonstrations for beginners and advanced workers are given, and there are ample facilities in the way of apparatus and material for practical work. Beginners are specially welcomed, but it should be noted that the Institute is for men only.

A one-man show of over 100 pictures is being held by Mr. H. Mills in the Y.M.C.A. Building, Bolton, during the current week. Mr. Mills has been a frequent contributor to these pages in the past and a collection of his work will be of considerable interest.

With the title "The English Countryside" the Ward Gallery, 3, Baker Street, W.1, have published a charming book of photography by J. Dixon-Scott. Forty full-page pictures are reproduced showing beauty-spots in all parts of the country. They are all of fine technical quality, and many are attractive pictures. A foreword by Rose Macaulay adds to the value and interest of the book, which is issued at 3s. 6d. and is obtainable from the above address.

On Wednesday, September 11th, presentations from the Directors and Shareholders and also from the entire staff of Jonathan Fallowfield, Ltd., were made to Mr. H. W. Fellows, on the

completion of fifty years' service with the firm, making the second occasion a member of the staff has served the firm for such a long period.

The Hon. Secretary of the Northallerton and District Photographic and Ciné Society—Mr. G. B. Welford—has recently resigned, and the Chairman, Mr. Geoffrey Todd, is acting in his stead *pro tem.* until the annual meeting in December. This Society has prepared an attractive winter programme and they welcome both beginners and advanced workers. Amateurs in the neighbourhood wishing to join should communicate with Mr. Todd at 14, Red Villas, Northallerton. He will send full particulars on request.

A new Criterion chloro-bromide paper has just been introduced by Criterion, Ltd., of Stechford. This will be known as Criterion Mezzotone "Lustra Silky," and, as its name indicates, has a beautiful silky surface texture particularly suitable for obtaining rich quality prints and enlargements. It is a slow development paper and gives a warm black tone by direct development with any standard chloro-bromide M.Q. developer, or the special formula strong in bromide supplied with the paper can be recommended. The paper is sold by all dealers at standard rates.

**Stolen.**—A 5×4 Tropical Sanderson, adapted for 9×12 cm. plates and equipped with a Zeiss Protar f/6.3 lens in Goerz shutter, complete in leather case with six teak double book-form slides, has been recently stolen in the City of London. If any reader can supply any information regarding this camera will they kindly communicate with *The Amateur Photographer*?

Owing to pressure on our space this week a number of "Letters to the Editor" have been held over. They will appear later.

## The Week's Meetings

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

### Wednesday, September 18th.

Borough Polytechnic P.S. "Wild Life of the English Countryside." J. Davis.  
Luton and D.C.C. Ickleford.  
Partick C.C. Print Criticism.  
Rochdale P.S. An Evening with Mr. J. Hargreaves.  
Stockport P.S. Chloro-Bromide Demonstration. J. C. Egan.

### Thursday, September 19th.

Bury P.S. "Making the Most of our Negatives." Mrs. W. Madelay.  
N. Middlesex P.S. "Truth, Art and Photography." Harold Ranson.  
Nottingham and Notts. P.S. Bottesford and Belvoir.

### Friday, September 20th.

King's Heath and D.P.S. "Highways and Byways in Shakespeareland." Wm. A. Clark.

### Saturday, September 21st.

Borough Polytechnic P.S. "Week-end Outing." A. H. Redman.  
Cripplegate P.S. St. James's Park.  
Exeter C.C. Muttons Moor.  
Hackney P.S. Zoo.  
Hanley P.S. Trentham.  
Ilford P.S. Knighton Wood.  
Northamptonshire N.H.S.P.S. Althorp Park.  
Plymouth I.P.S. St. John's.  
Sheffield P.S. Grindleford and the Surprise.

### Saturday, September 21st (contd.).

South Suburban and C.P.S. Red Book Day at the R.P.S.  
Stafford P.S. Eccleshall.  
Stockport P.S. Marple.

### Sunday, September 22nd.

Blackburn and D.C.C. Hurst Green.  
Borough Polytechnic P.S. Week-end Outing. A. H. Redman.  
Hammersmith H.H.P.S. Guildford.  
Medway A.P.A. Canterbury and District.  
Worthing C.C. Boxgrove to Slindon.

### Monday, September 23rd.

Oldham E.P.S. Copying through Lantern.  
Southampton C.C. Lantern Slide Evening.  
Walthamstow and D.P.S. Social Evening.

### Tuesday, September 24th.

Manchester A.P.S. "A Naturalist on the Amazon." E. A. Robins.  
Nelson C.C. Landscape Competition.  
St. Bride P.S. Chat on Pictorial Photography. S. Bridgen.

### Wednesday, September 25th.

Borough Polytechnic P.S. Annual General Meeting.  
Northallerton and D.P. and C.S. Y.P.U. Portfolio. Criticisms. R. Robinson.  
Rochdale P.S. Practical Demonstration on Enlarging.

# Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

## The Lone Member this Winter By M. A. LOVELL-BURGESS.

This note will be read with interest by many members of ciné clubs who hitherto have not had much to do with the club's activities but are keen and anxious to take part if given the opportunity.

**I**N a very few weeks from now amateur ciné club members will be meeting for the autumn and winter sessions. It would be interesting if one could test the reaction of the rank and file of members to that thought.

In so many ciné clubs the rank-and-file member becomes, not through any wish of his own, a passive looker-on. There are the club executives—splendid, hard-working people who get a lot of criticism and very little praise—and there is the film-making personnel in the form of producers, camera-men, players, and so on. But there still remain the amateur ciné workers who are not in demand as players or producers, and have not the wish, or the time, or perhaps the ability, to be officials. Yet such amateurs, as every club treasurer knows, are the backbone of the club. What is to be done about them?

### Encouragement Needed.

I think such people—often rather shy people—need definite encouragement. One of the best ways of "bringing them out" is to give them a little experimental work to do. It is no good asking them to give their opinion in public on editing, or montage, or colour films, but they could be asked to demonstrate whether it is true that seascapes can be photographed with great success without filters, or to experiment with angles, or to think out a few simple devices for masks or titling. And once their interest is aroused in their own work they will forget their self-consciousness in their eagerness to explain it to others.

It is a depressing sight, winter after winter, to see some twenty to thirty club members watching, week after week, the efforts of some half-dozen people, who meet mysteriously "on location" on their own, hold numerous committee meetings, and more or less efficiently "run the show." Probably all the jobs were left to them to do in the first place, and they would be only too grateful if someone else took a hand.

Remember that because a ciné club has a full attendance and docile members it does not mean that it has attained the ideal. The probability is that the members have got into a routine way and need to be surprised out of it.

The rule in every club should be that every member must do something to maintain the club's life. They also

pay who only stand and wait is not good enough in the long run, if only for the reason that people who get tired of being bored also cease, in due time, to subscribe.

### Expression Work is Wanted.

Go over in your mind now the members of your club. In that rapid mental review, are there not several people who simply sit about the studio listening or looking? If you want your club not only to pay its way, but to have a heartening vitality about it, study those people and provide them with something to do this winter according to their capabilities.

It is the cinema which has got so many of us into that fatal habit of just looking. The keynote of all modern education is to be found in expression work. Every club should have an ideas box, and the "ideas" should be read out and discussed each week. The best "ideas" should be filed for future reference. Members should be "told

off" regularly to review, for the club's benefit, a current professional production. It is marvellous what a lot of helpful ideas even an average film can give. Did you notice, for instance, how titles were used in "Clive of India," and how they gave the right suggestion of dignity and annals and ancient records? And there is some cutting in Janet Gaynor's "One More Spring" which really does suggest the joy and exultation of Easter morning. And "David Copperfield" is worth studying for its smooth handling of many themes and its ship sequence achieved with model shots.

Make a resolution that there shall be other than facial expression work for club members this winter. We hear a great deal about the problems of the lone worker. Let us remember the needs of the lone member. With a little encouragement he may quite possibly become a most important factor in the success of the club.

The swan song of Waterloo Bridge. Ciné amateurs should take advantage of the opportunity that remains for securing final pictures of this historic bridge.

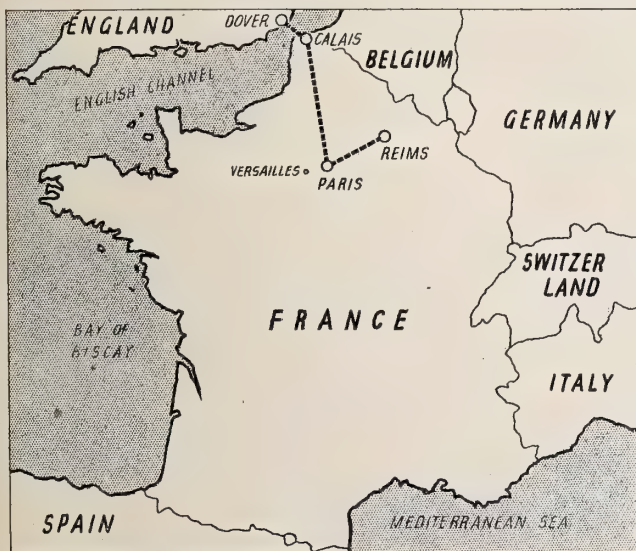

# Travel Titles

By  
ARTHUR A. TAYLOR.

**A**FTER the many cruises organised by the shipping companies this last summer there are large numbers of amateur movie makers who have made a complete record of a holiday spent afloat, all ready to be edited and titled for the Christmas *première*.

We have seen so many very good efforts of a continental travel picture spoiled simply for want of a little more care taken in the editing and making of the titles that this short article

has been specially written to give the amateur an idea of the "professional touches" that can, with desired effect, be quite easily worked into the home-made film.

The very first object to surmount is its continuity, or the placing of the different scenes in their correct order. In a travel film this requires much thought, as the continual moving from one place to another tends to leave the audience in rather a vague and confused state of mind as to their present positions.

The best method to prevent this and to provide some sort of continuity is to introduce a map into the picture.

It is not necessary to produce an elaborate map, as its only object is to show the directions taken during the making of the film. The method, if carefully followed as described, will be found to add quite a "Hollywood" touch to what would have otherwise passed as an amateur film.

A piece of good-quality smooth drawing-paper is required, about 18 x 12 in., and upon this is drawn the country described by the film. The outline is first of all made with pencil and then the coast is put in with a thick line of Indian ink, made either with special ball-headed pens or a brush, and later, shaded with a soft pencil if it has a coast. Only the places visited need be marked upon the map, as shown in the illustration, and the route taken is made by thick dotted lines.

The completed map is then shot with the camera and spliced in at the beginning of the film and once or twice during the scenes.

For the more ambitious amateur an animated map could be introduced. For this the outline is made in the same way and the map carefully fastened into a rigid frame, and, with the camera placed in position, a few frames are shot. The first town is now inked in without moving either the map or the camera, and a few frames shot of this first town and route, and then the route to the next part is added step by step, photographing for a few frames at every three or four dashes of the dotted line. So the procedure goes on until all the names are in and all the routes marked. This method will mean, with most cameras, double splicing, because every time the camera is stopped and restarted there will be a light frame.

A much quicker method will be found to take a long camel-hair brush, dipped into the Indian ink, and with the camera started, trace out the line as if you were using a pointer at a lecture, the only difference being that after the pointer has passed it will leave a black line. With this method, the names of the places visited must, of course, be put on the map before the photography begins.

Follow each insertion of the map with a close-up of the new location taken either from a railway station name-plate or from the map itself if your camera will allow a close-up of the name.

With a map like this, described in your travel films, the audience has a full knowledge of the district covered, and yet is able to follow it easily and comfortably.

## Exhibitions and Competitions

### CURRENT AND FUTURE.

*Notices of forthcoming exhibitions and competitions will be included here every week if particulars are sent by the responsible organisers.*

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers. Entries, September 30. Rules in the issue of August 28.

California Pacific International Exhibition, San Diego.—May 29–November 11. Miss Ruth Kilbourne, Secretary, Exhibition Headquarters, Balboa Park, San Diego, Cal., U.S.A.

Paris International Salon.—October 5–20. Secretary, M. E. Cousin, 51, Rue de Clichy, Paris.

Amsterdam International Salon.—September 14–29. Further particulars from Focus, Ltd., Fotosalon, Bloemendaal, Holland.

London Salon of Photography.—Open, September 14–October 12. Further particulars from Secretary, London Salon, 5a, Pall Mall East, S.W.1.

R.P.S. Annual Exhibition.—September 14–October 12. Further particulars from Secretary, 35, Russell Square, W.C.1.

Irish Salon (to be held at Mansion House, Dublin).—Open, November 2–9. Particulars from Hon. Secretary, Irish Salon of Photography, 18, Morehampton Road, Dublin.

Rotherham P.S. International Exhibition.—Entry forms due, September 23; prints, September 30; open, October 16–19. Hon. Exhibition Secretary,

E. George Alderman, Ruardean, Newton Street, Rotherham, Yorks.

Indian International Salon (promoted by Camera Pictorialists of Bombay).—Open, November 17–30. Hon. Salon Secretary, F. R. Ratnagar, Central Bank Building, Fort, Bombay, India.

G.W. Rly. "Camp Coach" Holiday Competition.—Prize, one week's holiday in camp coach during 1936 holiday season. Photographs should depict any aspect of camp coach holiday. Entries due, October 31. Further particulars from Superintendent of the Line, G.W.R., Paddington Station, W.2.

Canadian International Salon, National Gallery of Canada, Ottawa.—November 6–21, and afterwards in other Canadian cities. Entries due, September 20. Entry forms and further particulars from Exhibition Secretary, Canadian International Salon, National Gallery of Canada, Ottawa, Canada.

Seventh Western International Photographic Salon.—November 23–30. Entries close, Monday, October 28. Particulars and entry forms from the Organising Secretary, W. H. Hill-Muchamore, 24, Church Road, Redfield, Bristol, 5.

Cape of Good Hope International Salon (under the auspices of Cape Town P.S.).—Entries due, November 19; open, January, 1936. Hon. Salon Secretary, Richard Dekenah, P.O. Box 2431, Cape Town, South Africa.

IXe International Kertsalon Fotografische Kring "Iris".—Open, December 22–January 5, 1936. Entries close, November 15. Particulars and entry forms from J. Van Dyck, Secretary, "Iris," 69, Ballaerstraat, Antwerp.

Leicester P.S. International Exhibition.—Entries, January 24, 1936; open, February 24–March 7, 1936. Exhibition Secretary, H. Foscutt, 19, Doncaster Road, Leicester.

The 40th Annual Exhibition of the South London P.S.—Open, February 15–March 14, 1936. Entries close, January 21. Further details and entry forms from Hon. Exhibition Secretary, H. S. Adams, 40, Stockwell Park Road, London, S.W.9.

Scottish National Salon.—February 8–29, 1936. Entries close, January 11. Particulars and entry forms from the Hon. Salon Secretary, Norman G. Brown, 36, North Lindsay Street, Dundee.

VIIe Salon International D'Art Photographique de Bruxelles, 1936.—Open from March 21–April 5, 1936. Entries close, February 25. Particulars and entry forms from M. M. Devaivre, 152, rue Maréchal, at Brussels 3, Belgium.

Darwin Exhibition of Photography.—April 20–May 2, 1936. Entries close, March 19. Particulars and entry forms from the Secretary, J. H. Woods, South Down, Bolton Road, Darwin.

# Readers' Questions ANSWERED

**GENERAL.**—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

**CONTRIBUTIONS.**—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

**ENQUIRIES AND CRITICISM.**—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a separate stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

## Metal Tanks and Acid Hypo.

I develop, rinse and fix my plates in the same tank, but I now find that it is getting brassy inside and the plating is coming off in powder. What is wrong?  
C. D. B. (Herne Bay.)

It is generally quite safe to carry out all the operations in a metal tank provided that a plain fixing solution is used and not an acid one. This is the cause of the plating coming off, and if much damage has been done it is advisable to have it replated by the makers as the brass surface might have some bad effect in the future on the developer and cause fogged negatives.

## Developing Panchromatic Films.

Will you please outline the best method of developing panchromatic roll films by the dish method. Can one use a safelight for this type of film, and which is the correct colour of glass to use?  
C. F. B. (Drayton.)

If you have a light at all for panchromatic films you must make sure that you get the right one as stipulated in the makers' instructions, usually a dark green safelight. In our opinion your best plan will be to desensitise the films in total darkness, and then do the developing with a light which must also be safe for panchromatic material, but which may then be very much brighter than the one you would have to use without desensitising.

## Emulsion Side of Plates.

As I load my panchromatic plates in complete darkness, I sometimes find it difficult to decide which is the emulsion side. Is there any method of checking this?  
G. B. (Isleworth.)

All English manufacturers pack their plates in twos, with the emulsion sides face to face and not with them all facing in one direction. If you take them out one at a time this is a certain check. Failing this, another method is to bite gently on a corner of the plate and it will be found that the emulsion side will tend to adhere to the teeth.

## Bichromate Stain.

After bleaching out prints with potassium bichromate, I find great difficulty in washing out the yellow stain.  
W. I. W. (Caterham.)

We presume that you quite understand that the dark tones of the print will always retain the yellow stain and it is only the lighter tones that can be washed quite clear. If several changes of water will not clear them sufficiently, try adding a few drops of sulphuric acid to each change of water.

## Glazing Prints.

I have been experimenting with glazing my prints after fixing on ferrotype plates. Unfortunately, they nearly all stick to the sheets, and when this happens I can only remove them by scraping them off. What is the correct procedure?  
A. E. A. (Coventry.)

You talk about glazing the prints after fixing, but we presume you wash them before doing so. Provided your ferrotype plate is perfectly clean the prints should come off without the slightest trouble when quite dry. If you have been scraping them off you may take it that your ferrotype plate is ruined. It would help matters, although not absolutely necessary, if, at the end of the washing, you give the prints two or three minutes in a 10 per cent solution of formalin, and then transfer them straight to the slabs without further washing.

## Pink Stain on Negative.

I am enclosing a film negative which is still a pink colour despite thorough fixing and prolonged washing. How can I remove this colour?  
A. C. A. (Barnes.)

The red dye in your negative should disappear during fixing, especially if an acid hypo bath is used. Any trace of it remaining should vanish in the washing water. The stronger patch of colour in one part of your negative indicates something wrong with your methods.

## Red Dye for Negatives.

I believe that there is a red dye available for local control work in negatives. What is it called and where can I buy it?  
E. S. B. (Derby.)

The dye that you refer to is neo-coccin. It is a powder, which, in solution, gives a red stain, and it is used for painting over parts of negatives that are too thin and weak.

This has the effect of slowing up these parts in printing speed so that they become lighter in tone than they would have been compared with other areas of the print.

This dye is obtainable in small tubes from Agfa, Ltd., 4, Lawrence Street, London, W.C.2.

## Postal Clubs.

I should like to join a postal photographic club in England. Can you give me a list of such clubs which are not too advanced in the standard of work?  
D. S. (Dublin.)

There are too many postal clubs in existence for us to be able to give you a list in the form of a reply, but you will find a complete list in "Photograms of the Year." The secretaries of these will no doubt give you an idea of the standard of work expected.

## Exposures and Stop Values.

Am I right in assuming that the exposure time varies inversely to the stop used? How can I arrive at this ratio of exposure? Is there any objection to using a constant shutter speed and only altering the stop to suit the exposure?  
J. F. (Stoke Poges.)

It is quite correct to assume that the exposure time is in inverse ratio to the diameter of lens stop. In a general way you have to double the exposure time every time you pass from one stop to the next smaller. This is shown if you square all the f/ numbers. For example, if you square 4.5 and 6.3 you will find that the results are approximately 20 and 40, and that is the ratio of the exposures. Further, f/6.3 requires double the exposure of f/4.5. It is quite a common thing to keep the shutter speed constant and alter the stops according to circumstances. There are cases, however, in which this is not the most satisfactory method.

## Infra-red Photography.

Can you inform me of any standard handbook dealing with the subject of infra-red photography?  
A. B. (Folkestone.)

The standard book on infra-red photography is "Infra-red Photography," by S. O. Rawling, published by Messrs. Blackie & Son, Ltd., 50, Old Bailey, London, E.C.4, at 3s. 6d. net. You had better study this book before attempting work with your camera, as you will find that precautions have to be taken as to the dark slides used, and so on.

## Process Engraving.

If there are any correspondence courses available for process engraving, can you let me have particulars of these or of any handbook dealing with the subject?  
G. H. (Accrington.)

We do not know of any correspondence courses on process engraving. Many books are available on the various branches of the subject, and to obtain knowledge of these we should advise you to communicate with Messrs. Hunter-Penrose, Ltd., of 109, Farringdon Road, London, E.C.1.

CLOSING DATE

Thursday, October 31  
1935

## ANNUAL Lantern-Slide Competition 1935

EVERY reader of *The Amateur Photographer* who is interested in the making of lantern slides should participate in "The A.P." Annual Lantern-Slide Competition. Not only are the seven classes comprehensive in their variety of subjects to suit all workers, but inclusion of slides in "The A.P." prize set which circulates throughout the British Isles can be considered as the hall-mark of excellence, which every lantern-slide maker should strive for. Each succeeding year the competition proves increasingly popular, and has come to be regarded as a test of merit in lantern-slide production. We hope, therefore, that again this year every lantern-slide maker will enter the competition. The conditions and awards are set out below. It should be noted that

the awards are made to individual slides and not to sets; but every competitor can send as many slides into as many classes as he or she desires. The slides are judged on the screen under the best conditions. After the judging the prize-winning slides, and a number of others which are selected for purchase, form the exhibition collection which goes on tour to all parts of the country for a year or more. Secretaries of photographic societies who have not yet booked the set of "A.P." Prize Slides should hasten to do so, and submit alternative dates. This is necessary to enable a complete and expeditious itinerary to be arranged before the slides start on their journey in November. In the meantime, those who intend entering this competition should note that the closing date for receiving entries is Thursday, October 31st.

### Classes and Subjects.

- CLASS I.—Landscape with or without figures, sea subjects and river scenery.  
CLASS II.—Portraiture and figure studies, whether indoor or outdoor pictures.  
CLASS III.—Architecture, interior and exterior.  
CLASS IV.—Flowers, fruit and other "Still-Life" subjects.

- CLASS V.—Natural History subjects.  
CLASS VI.—Lantern slides in colour (not hand-coloured).  
CLASS VII.—Champion Class. Open only to those who have won silver or bronze plaques in *The Amateur Photographer and Cinematographer* lantern-slide competition.

### Conditions and Awards.

(1) All classes are open to amateur and professional photographers without any restrictions. All slides must measure  $3\frac{1}{2} \times 3\frac{1}{4}$  in., and must be properly spotted for showing in the lantern.

(2) One silver plaque, one bronze plaque, and four certificates are offered in each class except Class VII. In that, the Champion Class, the award will be a mounted and signed exhibition picture by Mr. F. J. Mortimer, the Editor of *The Amateur Photographer and Cinematographer* and *Photograms of the Year*.

(3) All slides which receive any award will become the property of *The Amateur Photographer and Cinematographer*, and will be sent round amongst the societies and such other associations as apply for the loan of them. Any other slides may be selected for circulation in this manner, and will be paid for at the rate of half a crown each.

(4) Competitors may send any number of slides in any class, and may be recorded as winning any number of awards; but no competitor will actually receive in the competition more than one silver plaque, one bronze plaque, and one certificate, on which all his awards will be recorded. Competitors may enter in any number of classes.

(5) Each slide must bear the competitor's name, its title and its class. With the slides must be sent an envelope containing the name and full address of the competitor, a list of

the titles of all the slides he is sending in, and the class in which such are entered. Particulars as to make of plate, exposure, developer used, etc., and other technical data which may be of interest for incorporation in the notes which will accompany the winning slides on their tour among the photographic societies, should also be given where thought necessary.

(6) A stamped and addressed label (not loose stamps) should be sent with the slides for their return if unsuccessful; but in no circumstances can the Editor or the Publishers accept any responsibility for slides sent in for competition, nor for their return; neither can slides be returned which are not accompanied by stamps as above.

(7) Not more than one slide from any one negative can be admitted, nor may any slide compete which has before won an award in these competitions.

(8) The last day for receiving is Thursday, October 31st. The slides must be well packed and addressed, "Slide Competition, The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and all carriage charges must be prepaid.

(9) In any case of dispute, the competitor agrees to accept the decision of the Editor of *The Amateur Photographer and Cinematographer* as final.

## Business Notices

### Publishing

**OFFICES.**—Dorset House, Stamford Street, London, S.E.1. Telegrams: "Amaphot, Sedist, London." Telephone: H3p 3333 (59 lines).  
**PUBLISHING DATE.**—"The Amateur Photographer and Cinematographer" is on sale throughout the United Kingdom every Wednesday morning.  
**SUBSCRIPTION RATES.**—British Isles 17/4 per annum, Canada 17/4, other countries abroad 19/6 per annum, post free.  
**REMITTANCES.**—Cheques, etc., should be crossed and made payable to Iliffe and Sons Ltd. "The Amateur Photographer" can be obtained abroad from the following: **UNITED STATES:** The International News Co., New York. **FRANCE:** W. H. Smith & Son, 248, Rue Rivoli, Paris; Hachette et Cie, Rue Reaumur, Paris. **BELGIUM:** W. H. Smith & Son, 71-75, Boulevard Adolphe Max, Brussels. **AUSTRALIA:** Gordon & Gotch, Ltd., Melbourne (Victoria), Sydney (N.S.W.), Brisbane (Queensland), Adelaide (S.A.), Perth (W.A.), and Launceston (Tasmania). **NEW ZEALAND:** Gordon & Gotch, Ltd., Wellington, Auckland, Christchurch and Dunedin. **INDIA:** A. H. Wheeler & Co., Bombay, Allahabad and Calcutta. **CANADA:** Imperial News Co., Toronto, Winnipeg and Vancouver; Benjamin News Co., Montreal; Gordon & Gotch, Ltd., Toronto. **SOUTH AFRICA:** Central News Agency, Ltd.

### Displayed Advertisements

Communications on Advertisement matters should be addressed: The Advertisement Manager, "The Amateur Photographer and Cinematographer," Dorset House, Stamford Street, London, S.E.1. Copy for displayed advertisements for the issue of any particular week must reach Dorset House by the first post on Tuesday morning in the week previous. Rates and conditions will be sent upon application.

### Prepaid Advertisements

#### SALE AND EXCHANGE: AMATEURS ONLY—

12 words or less ..... 1/-  
 1d. for every additional word.

#### PROFESSIONAL AND TRADE:—

12 words or less ..... 2/6  
 2d. for every additional word.

Each paragraph is charged separately.

**SERIES DISCOUNTS** are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid and posted to arrive at the Head Office, Dorset House, Stamford Street, S.E.1, not later than first post **FRIDAY** for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 260, Deansgate, Manchester, 3; 28a, Renfield Street, Glasgow, C.2.

Advertisements are inserted, as far as possible, in the order received, and those received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

Postal Orders sent in payment for Advertisements should be made payable to **ILIFFE AND SONS LTD.**, and crossed

& Co.

Notes being untraceable if lost in transit, should not be sent as remittances.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

**BOX NUMBERS.**—For the convenience of advertisers, letters may be addressed to numbers at the office of this paper. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charges, which must include the words: "Box 000, c/o 'The Amateur Photographer'." Replies should be addressed: "Box 000, c/o 'The Amateur Photographer,' Dorset House, Stamford Street, London, S.E.1," and these letters will be simply forwarded by us to the advertiser. It must be understood that we do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisement. Readers who reply to Box No. advertisements are warned against sending remittances through the post except in registered envelopes. In all such cases the use of the "Deposit System" is recommended.

### Special Note

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post. When sending remittances direct to an advertiser, stamp for return should also be included for use in the event of the application proving unsuccessful.

### Deposit System

Readers who hesitate to send money to advertisers in these columns may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Amateur Photographer and Cinematographer," both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods, they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in the event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For all transactions up to £10 a deposit fee of 1/- is charged; on transactions over £10 and under £50 the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, one-half per cent. All deposit matters are dealt with at Dorset House, Stamford Street, London, S.E.1, and cheques and money orders should be made payable to Iliffe and Sons Ltd.

## WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

## CAMERAS AND LENSES

**12**×10 Complete Outfit, Cooke anastigmat lens, £20, nearly new, cost over double; 4-pl. Set, 27/6; approval deposit.—Bennetts, Photographer, Camborne. [9374]

## NEW ZEISS IKON PRECISION ● TWIN-LENS REFLEX IKOFLEX ●

The Ikoflex is a beautifully-made  
twin-lens reflex which gives brilliantly  
crisp pictures of the highest precision  
quality. A new departure is a special  
Zeiss condensing lens underneath the  
ground glass giving brilliant viewing  
and illumination right to the very  
corners of the picture.

The camera is built from a die-cast  
body that will last a lifetime and will  
not damage or dent if accidentally  
dropped. The price is a most compelling  
low one, and all unique twin-focus  
reflex features.

Specification.—Die-cast  
body, helical focussing  
self-erecting hood, black  
leather inlaid covered,  
automatic film winding,  
compensation for parallax,  
depth-of-focus scale, large  
finder lens, magnifier in  
hood, and fitted with  
various lenses below.

Zeiss Novar f/6.3, in Ikoflex shutter ..... £6 10 0  
Zeiss Novar f/4.5, in Ikoflex shutter ..... £7 10 0  
Zeiss Novar f/3.5, in New Compur ..... £12 2 6

The best  
Photo  
Corners!

## "TRANSPAROL"

are made of pure "Cellophane" (Reg. Trade Mark),  
and not cheap imitation material. They are  
invisible, and show the picture up to its extreme  
edges. 6d. per box of 100.

They do not stick together and ruin  
the snaps like those of inferior makes.

## "FAVORIT"

are handsome opaque corners, easily and quickly  
fixed in position. Very ingenious—they make  
snapshots albums very beautiful—and eliminate the  
bugbear of messy paste pot and brush. Made in  
Sepia, Grey and Black. 6d. per box of 100.

WANTED for Prompt Cash, Home Cine Pro-  
jectors, Cameras, Films, Accessories, also  
Modern Cameras.—Frank, 67, Saltmarket, Glasgow.  
[9272]

## NON-FLEX SHUTTER RELEASE

The position of the release on shutters fitted to  
many hand cameras is inconvenient when using  
the camera at eye-level. The Non-Flex Shutter  
Release is screwed into the shutter in the same  
manner as the ordinary flexible release, and  
permits of the shutter being released by the  
forefinger when the camera is held at eye-level,  
thus ensuring steadiness and obviating the  
danger of moving the camera.

Price 1/6

New pattern flexible spiral release which works equally well  
when coiled as when straight. No fear of the release not  
working owing to internal friction. Made in three sizes for  
Compur, Vario, Itho and other between-lens shutters.

New Flexible Type Release. Prices:

3 in. long.....	1s. 3d.
6 in. long.....	1s. 3d.
10 in. long.....	1s. 6d.

## EXTRA LONG SHUTTER RELEASES

20 in. long to fit Compur shutters.....	2s. 6d.
40 in. long to fit Compur shutters.....	3s. 6d.
Leather-cloth case.....	1s. 6d.

## FLEXIBLE EXTENSION SHUTTER RELEASES

The Extension Release is coupled to the ordinary flexible  
release and the shutter is then discharged by pressure on the  
plunger on the extension release.

2 yards long.....	8s. 0d.
3 yards long.....	8s. 0d.
4 1/2 yards long.....	10s. 6d.
6 yards long.....	12s. 6d.
Leather-cloth case.....	1s. 6d.

As advertisements on these covers go to press a fortnight in advance some of these second-hand items may be sold already, but similar outfits are usually available.

### EASY TERMS & EXCHANGES

Anything on nine equal monthly instalments. First payment secures the goods to use while you are paying the balance. High allowance on your used apparatus in exchange.

### A GENUINE TESTIMONIAL

"I have to write and thank you for the very kind personal treatment extended to the writer, in the very handsome outfit you forwarded and at such a cheap figure." F. W. G.

An indispensable asset all the year round!

## ZODEL LENS HOOD

It is not only in the summer that the Zodel lens hood is indispensable. In autumn photography, with the sun at a lower altitude and giving many beautiful shadow patterns and against-the-light effects, a lens hood is even more necessary. Good shots, too, can be obtained on wet days with the aid of a Zodel lens hood—in fact, the scope of your photography is widened considerably during the autumn and winter months. Zodel lens hood is telescopic and folds flat for carrying. It is easily fitted to almost any camera. State size of lens when ordering.

## Autumn is a great pictorialist

Morning mists and a softer sun make pictures where there were none before. Light is mellow, tones are richer. Now, more than ever, you need to use Kodak "Panatomic" Film, with its fine-grain fully panchromatic and anti-halation backed emulsion.

## FOR BRILLIANT PROJECTION OF BOTH FILM SIZES

## PAILLARD - BOLEX

### MODEL G.916 PROJECTOR

A perfect optical system giving maximum illumination with either 250 or 500 watt lamps—that is the reason for the amazingly high standard of screen illumination obtainable with the Bolex.

Other distinctive points are : Takes both 9.5-mm. and 16-mm. films. One hundred per cent gear driven, no belts or springs. Automatic reverse action. Still pictures for any length of time without blistering. Exceptionally steady even at talkie speed, 24 pictures per second. Dallmeyer 2-in. lens as standard equipment. Available with interchangeable lenses from 1 in. to 4 in. Perfect projection of 9.5-mm. films without any possibility of scratching.

PRICE : With 500-watt lamp  
with resistance for all voltages **£49:10:0**

# CUT OUT FILM WASTE, WITH Rolleicord

Easily the Best of the Popular-Priced Roll-film Reflexes

Every square inch of film costs money. Rolleicord utilises your film to the best advantage and thus saves pounds in the long run. With Rolleicord you can be sure of getting the picture you want—you see it full size and right way up on the ground-glass screen and if you do not care for the picture you can discard it BEFORE YOU WASTE FILM ON IT. Rolleicord takes 12 pictures for the price of eight (12 exposures on  $3\frac{1}{2} \times 2\frac{1}{4}$  8-exposure film). It is fitted with one-lever Compur shutter, speeded to 1/300th sec., T. and B., and Zeiss Triotar f/3.8 lens, optical equipment which makes it a splendid all-the-year-round camera. With leather-covered body. May be adapted for plates and many Rolleiflex accessories..... £12 15 0

With metal body and f/4.5 Zeiss Triotar lens, for roll films only..... £10 10 0

## MINIATURE CAMERAS AND ENLARGERS

We specialise exclusively in miniature cameras such as the Leica and the Contax. This fact has been appreciated by the photographic public, and deals involving miniature apparatus now tend automatically to come to us. Remember, by buying your camera or enlarger from us, you will be entitled to very special consideration at any time you may wish to dispose of it—either for cash or in part exchange. Every miniature camera of distinction, together with a full range of accessories, is to be seen at our showrooms.

# ZEISS

**PHOTOGRAPHIC LENSES**—apart from their unquestionable superiority of design—are manufactured under such ideal conditions that

## The BEST DEFINITION

is assured for each and every lens which succeeds in passing the stringent tests of the ZEISS factory.

## For MINIATURE CAMERAS

the UTMOST PERFECTION of definition is a *sine qua non*, and neglect to insist on a ZEISS lens is undoubtedly responsible for many failures and much disappointment to owners of miniature cameras.

Write for List P.51, and details of the best lens for YOUR camera, to **CARL ZEISS (LONDON) LTD.**  
37-41, Mortimer St., London, W.1

# Isopan I.S.S.

Superseding the Superpan emulsion, Agfa Isopan I.S.S. is an ultra-speed, panchromatic emulsion, unequalled for all branches of autumn and winter photography.

The speed allows instantaneous exposures to be made indoors with ordinary lighting, in the streets at night, and in the most adverse conditions of fading light.

*Stocked by all the leading dealers.*

REVISED THROUGHOUT AND BROUGHT RIGHT UP TO DATE

# PHOTOGRAPHY MADE EASY

By R. CHILD BAYLEY  
Author of "The Complete Photographer,"  
"Hand Cameras," "Photographic  
Enlarging"

## AS EASY AS A · B · C

This is a book for photographic beginners, and, if carefully studied, it will enable the novice with a camera to get a greater proportion of successful photographs than would usually be the case.

"Photography Made Easy" should be read by everyone taking up photography: it should form as much a part of the outfit as the camera itself: it is an ideal present to give an amateur photographer.

# COLOUR!

ANYONE who can take ordinary snaps can now photograph in natural colours. No special apparatus is required, not even a colour filter. With your ordinary camera and a spool of Dufaycolor film you are ready to make pictures which reproduce faithfully the colours of the original scene.

Buy a spool now and learn how simple Dufaycolor photography really is. There is nothing to learn—the beautiful colour transparencies will amply repay you for the slight extra cost of Dufaycolor film.

YOUR PHOTOGRAPHIC DEALER CAN NOW SUPPLY

## DUFAYCOLOR

### ROLL FILMS & FILM PACKS

#### FOR AMATEUR CINEMATOPHOTOGRAPHERS

Natural colour photography is also available for the amateur cinematographer using 16 mm. cameras. DUFAYCOLOR CINE FILM IS SOLD IN 50 FEET AND 100 FEET DAYLIGHT LOADING SPOOLS. No additional attachments are required, but a plain single-colour daylight compensating filter is supplied free with each carton of film.

*Sensitised and sold by*

## TOPICS of the WEEK

IN this the Autumn Number of *The Amateur Photographer* many of the activities that go to prove the all-the-year-round qualities of the most fascinating of modern hobbies are dealt with. Outdoor photography in autumn and winter is now just as simple and can be equally successful as taking summer snapshots. The days are, of course, shorter, but the effects are more varied and beautiful; the temperature may be lower but it is far more healthy to seek the countryside under such conditions than in the sweltering heat of summer. In fact there are many strong arguments in favour of photography in the open at this time of year; and if the amateur resolutely refuses to sally forth with his camera, the photographic work that awaits him and calls for attention indoors is without end. Many phases of these activities find a place in the following pages.

### Thinking out the Picture.

A writer in *The Times* urges upon us the value of doing nothing, the cultivation of the art of being quiet and merely looking on. The spectator's role is often more difficult than that of the performer. People on a long railway journey while away the time by eating unnecessary meals or reading superfluous books, doing anything rather than look out of the window on a varied scene which, with the exercise of a little imagination, becomes as interesting as any film—although, to be sure, our railways were not built with the idea that passengers should enjoy the scenery. The photographer sometimes bemoans the fact that he only sees his pictorial opportunities when he has not got his camera with him; but perhaps it is a good discipline not to have a camera, and to try and see the picture with the mind's eye—a useful preliminary, though often a neglected one, to getting it on the plate.

### "Photograms of the Year" and the Photographic Society Directory.

*Photograms of the Year* 1936 is now in active preparation and will again be issued early in December. The Photographic Society Directory, which is a notable and useful feature of the Annual, is again being compiled, and a letter has been sent to every photographic society in the country asking for the latest information concerning it. If, however, there is any one that has not received the application we hope the Honorary Secretary will send full details direct to the Editor without delay, as it is assumed that any society from which we do not have a reply by September 30th is either defunct or does not wish to be included in the Directory. Last year the *Photograms* Photographic Societies' Directory was the only one published in this country, and was in great demand by amateur photographers who wished to ascertain the nearest society.

## READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with on this page week by week. Other replies appear as usual on the last page.

### Making Lantern Slides.

*I am thinking of starting lantern-slide making, but my negatives are of several sizes, some very small, and I am uncertain about the best methods. Can you put me on the right lines as to apparatus?*

R. E. A. (Rugby.)

We wish you had given some particulars as to the sizes of your negatives, and whether they are on plates or films. As it is you open up rather wide fields, and we can only give you general hints for your guidance.

If you want to make a slide from the whole of a negative more than  $3\frac{1}{4}$  in. long you will have to use some form of reducing camera. Such apparatus has been described and illustrated in our pages. It can be obtained commercially, or can be improvised with the aid of a camera, preferably of the "field" type, that will carry a lantern plate in a dark slide. Quarter-plate is convenient, as the slide needs only two half-inch strips to make the lantern plate fit centrally.

It is probable, however, that you

can make most, if not all, of your slides by contact, much in the same way as you would make a gaslight or bromide print.

The diagram (from the new Ilford Manual) shows one of several types of frames available for this work. The negative is laid face upwards on the velvet-covered bed of the frame, and the smaller hinged frame closed down over it to keep it in position. It is adjusted so that the part to be included is correctly positioned in the  $3\frac{1}{4}$ -in. square opening. The lantern plate is dropped in, face downwards, and pressed into complete contact by another hinged flap fitted with a spring.

In some cases the hinged frame closing down on the negative is fitted with a glass ruled off into small squares, to facilitate getting verticals and horizontals correct, and to secure accurate margins. Other forms of frames are simpler in construction, but quite effective in use.

As you say that some of your negatives are very small you no doubt have an enlarger of some sort, and it is highly probable that with its aid you can make your slides by projection. It is, of course, possible to print by contact from even the smallest negatives by the method indicated, but this is not altogether desirable for negatives much below  $3\frac{1}{4} \times 2\frac{1}{4}$  in. When slides are projected on the screen it is unpleasant if some fill most of the area of the slide, and others only a small proportion of it. Such jumps in size are irritating.

Whereas years ago so many slides were made by reduction from the whole or part of large negatives it has now become advisable to make slides by actual enlargement, and many modern enlargers will accomplish this quite easily. If not, the temporary substitution of a lens of rather shorter focus will do all that is required. In fact, with many enlargers, especially of the vertical type, it is possible to make slides by projection, on a scale either larger, smaller, or the same size, compared with the negative image.

When using a horizontal enlarger for the purpose it is an easy matter to improvise a carrier for the lantern plate so that it can be attached to the easel.

# ENLARGERS and ENLARGING

It is fairly certain that most photographers returning from their vacations will have at least a small percentage of their negatives which

can be advantageously enlarged, and this is the time to undertake the work. The purchase and manipulation of a suitable enlarger is a matter for some study, and, while it is difficult to discuss the matter fully in a limited space, the most important points are reviewed below.

**T**HE beginner, once he becomes the possessor of an enlarger, is well on the way to becoming a fully-fledged photographer and exhibitor, since the instrument and the operation thereof open up a hitherto undreamt-of field of work for his exploration. But modern manufacturers have put upon the market so many and varied types of instruments that the amateur is liable to be confused when considering the purchase of one.

These pieces of apparatus may be divided into three classes for general discussion, viz., horizontal, vertical, and condenserless.

## Horizontal Enlargers.

The horizontal enlarger was until quite recently the most generally used type of instrument, and very serviceable it is. While not quite as simple in operation as its vertical relation, it has the advantage of being very versatile, and things can be done with a horizontal enlarger which would be impossible with a vertical one.

Correction of uprights, shading, over-printing some parts of the negative are much easier with the horizontal instrument than the vertical, although these feats can be performed with the latter with some ingenuity.

Perhaps the biggest disadvantage about the horizontal apparatus is that it takes up a considerable amount of space, and in these days of small dwelling-houses and flats this is a consideration.

On the other hand, the worker who is contemplating the purchase of an enlarger, and who has the available space, will be well advised to invest in a second-hand horizontal instrument, of which, owing to the advent of large numbers of the vertical type, there are considerable numbers on the market at a fraction of their original cost.

With the horizontal, the light has to be manipulated somewhat more carefully, and must be centred on the easel both before inserting the negative and after the required degree of enlarge-

ment has been obtained. This is a matter readily acquired by practice, and most amateurs mark their light position inside the lamphouse.

An easel which can be placed square with the outfit is also a necessity with the horizontal enlarger, and some very ingenious types of easel are on the market. The amateur can, however, quite easily construct his own easel with a piece of three-ply wood that can be held firmly in position during exposure.

## Vertical Models.

The vertical class of enlarger can be divided into two sections, those with condensers and those without. Many and varied are the opinions among amateurs on the question of which is the better of the two, but, of course, a lot depends upon the class of work the photographer undertakes.

With the small negatives so popular to-day the condenserless type of instrument is capable of producing first-class enlargements, since it is quite possible to illuminate evenly the negative without a condenser.

The condenser, on the other hand, has the advantage of concentrating all the available light on the negative, and thus enhances every tiny detail, and with the detail—to some workers' annoyance—every blemish on the negative, including coarse grain.

If, however, a diffuser is used, such as a piece of finely-ground glass, in front of the light and close to the condenser, one gets the advantage of the condenser without the glaring revelation of the negative blemishes.

Economy in space is undoubtedly the secret of the success of the vertical enlarger. It takes up only a few inches square in the dark-room, and, in most of the latest type, focussing is automatic, position of light and lens and easel all being worked out in a series of ratios, which only means the manipulation of a lever or so to project a sharp image of the right size upon the easel, which is an integral part of the instrument, and therefore always in correct relation to it.

## Illuminants.

The question of an illuminant is no longer a serious problem. The universal adoption of electricity, even in villages, makes it possible to use what is one of the most convenient light sources, the half-watt, gas-filled electric lamp, usually of the pearl type. These are clean, safe, and give off a minimum amount of heat. Incandescent gas may be used where electricity is not available, its one disadvantage being the heat generated. Mercury vapour lamps are sometimes used by more advanced workers, but are hardly likely to interest the ordinary amateur.

Daylight enlargers have not been included in this note because at the time of year which is approaching daylight is so unreliable as a light source, and most amateurs are engaged in the important business of obtaining a living during the lighter portions of the day, that these instruments, excellent though they are in certain circumstances, cannot be recommended for the coming season.

There are also on the market many enlarging attachments which can be used in conjunction with the worker's own camera, thus giving the extra advantage of using the same lens for enlarging as the negative was taken with.

## Making a Start.

The worker making his first attempts at enlarging should be prepared for some disappointments. The purchase of a good photographic enlarging textbook is really an essential, and the careful study thereof will do much to eliminate waste. Full use should be made of the test strips supplied with most packets of bromide, and the worker will be well advised to restrict himself to small sizes, say, half-plate, until he is competent to produce a good small enlargement, when it is but a step to the larger size.

Certain it is, that once the worker puts his feet on the enlarging road, he will not regret the step he has taken, in view of the wideness of the field open to him.

# Autumn Subjects for the Outdoor Photographer

By D. SWAINE.

AUTUMN is not a long season; October and half November sees the extent of an outdoor season which, while not so photographically important as the spring, is still a period which provides subjects and effects of a distinctive type and often unusual beauty.

With the passing of the brilliant summer light there is a general improvement in the conditions which make for pleasing town photography. The lessened power of the sun causes morning mists to hang about until much later in the day, and pictures of real beauty can be made from material which would have been unconsidered a short time ago. The long, slanting rays of the sun assist in this transformation, and where it is desired to secure an effect of mist and sunshine it is essential to expose "against the light" and use no filter; the latter has a tendency to cut out mist.

In the wooded areas, perhaps the most important from the autumn photographer's viewpoint, similar conditions will naturally be sought by the pictorial aspirant, and, as a supplement to the golden glory of the trees and carpeted glades, figure subjects should be watched for: a man sweeping leaves, perhaps with a horse and cart near, people walking with bunches of leaves gathered for decoration, or boys playing with "conkers" (ripe horse chestnuts).

*An October sunsplash.*

In the south of England harvesting is not generally an autumn subject; it is usually over by September. But in the orchard pleasing figure studies can be arranged during the fruit gathering, while the garden with a good show of chrysanthemums can be a veritable paradise for pictures, either of the blooms themselves or these in conjunction with suitable figures. A bright, diffused side-light with a small stop and a full exposure are necessary, when photographing such flowers. It need hardly be said that in a season when reds and golden browns predominate, panchromatic materials must be used if anything like nature's dazzling palette of colour is to find its replica in monochrome with any truth.

This period of the year sees the commencement of the annual "burnings" on farms and in the gardens. Here is a subject which rarely receives the attention

it deserves, for there is a wealth of beauty in the dispersal of smoke on a not too windy day. If this can be viewed against a dark background it is best, otherwise there will have to be a carefully judged exposure with a filter so as to bring out the smoke clouds. On no account forget the pan. film, for not only does it give the correct rendering of vividly coloured objects but it retains its speed on towards evening, owing to its sensitivity to the yellow-red light.

*Burning Autumn leaves and weeds.*

# Indoor Picture Making is so easy with **ENSIGN LIGHTING EQUIPMENT**

*The Ensign Multiflood can be turned in any direction, and will hang or stand anywhere.*

**Light wherever you want it!**

## **ENSIGN "MULTIFLOOD" OUTFIT**

Gives a mighty flood of light in any direction. 12-in. reflector with adjustable head—hangs on picture rail, stands on floor, or anywhere. Complete with 6-ft. flex, plug and universal head stand (without lamp).....6/-

Osram Photoflood lamp, any voltage, 2/6

**For easy dramatic effects.**

## **ENSIGN "PHOTO-SPOT" Portable Spotlight**

Essential for really dramatic effects. Packs into a small space.

No. 1 Outfit, with stand and spotting attachment (without lamps) **£2 12 6**

No. 2 Outfit, with base and spotting attachment (without lamps)

**£1 17 6**

Osram Photo-flood lamp, any voltage, 2/6

## **Indoor Snapshots are easy with ENSIGN PHOTO FLASH-BULB OUTFITS**

Operated from an ordinary torch battery, these outfits ensure instantaneous pictures without smoke, dust or noise. Can be used anywhere.

No. 0 Outfit, with 2 small Philips Photoflux bulbs, Silverlite folding reflector, torch battery and test bulb, **5/6**

No. 1 Outfit. As above, but two large bulbs and Multiray metal reflector.....**12/6**

## **For genuine synchronised indoor snapshots use the ENSIGN SYNCHROFLASH OUTFIT**

The ideal method of taking flashlight pictures. Easily fitted to the camera (and easily removed). Shutter and flash are operated simply by pressing release. For flashbulbs or flashpowder.

Model No. 5. A complete outfit including torch and heavy case stand, flex leads and connections, reflector and 4 Photoflux bulbs. For use with between-lens shutters.....**£1 7 6**

*Details of seven other models will be found in "Winter Nights with a Camera" by Ensign.*

**ENSIGN, Limited, HIGH HOLBORN, LONDON, W.C.1**

## YOU CANNOT DO BETTER

### THE LEITZ "FOCOMAT" ENLARGER

With automatic Focusing.  
Takes the standard 5-cm. focus Leica lens, screw-in fitting, automatic focussing adjustment, scaled from 2 diameters up to 10 diameters. Will take negatives 18×25 mm., 24×36 mm., 3×4 cm., and 4×4 cm. Metal masks can be supplied for any of these sizes.

£16 : 6 : 6

Nine monthly payments of 38/1.

### LEITZ VALOY ENLARGER

£9 : 11 : 6 Nine monthly payments of 22/4.

### THE EXAKT ENLARGER

A de luxe Outfit.

A highly efficient Automatic Enlarger. F/4.5 Stenheil Casar anastigmat, high-class condenser, perfect sharpness guaranteed—all you have to do is turn the hand wheel on the support to size of picture required and then set pointer on adjusting ring of the lens to the same figure. Metal lamp-house. Wooden baseboard. Complete with all electric fittings (please state voltage when ordering). Model Ia for 2.5 to 10 times linear enlargements from 4×4 cm. negatives.....

£13:10:0

Nine monthly payments of 31/6.

Model II for 2 to 7.8 times linear enlargements from 6×6 cm. negatives and sections of i-plate.....

£18:0:0

Nine monthly payments of 42/-

Model III for 1.7 to 6.3 times linear enlargements from negatives up to 3½×2½ and sections of i-plate.....

£19:10:0

Nine monthly payments of 45/6.

### THE ENSIGN MIDGET Magnaprint Enlarger

F/6.3 Ensar enlarging lens, specially designed condenser for enlargements up to 15×12 in., chart giving various sizes. Will also take half-V.P.K., Leica, or other small negatives. Complete with electric fitting. Less lamp.

£4 : 10 : 0

"BLENDUX"  
For cine cameras. 84/-  
Nine monthly payments of 8/11.

# EASY LETTERING

## for Amateur Photographers

By LEONARD G. BENNETT.

THE season for making exhibition prints is now with us, and adding titles to the mounts is a matter that should be given more attention than it generally receives. The time is also approaching when amateur photographers will be preparing greeting cards, calendars, etc. The urge will be felt to inscribe upon these names and other items in lettering, which, when well done, can be an improvement to the gift, and also add an additional personal touch.

Good lettering for titles, etc., is usually the weakest of the amateur's accomplishments, but, given the right tools and a little care and practice, the matter can be easily dealt with in a satisfactory manner. The tools required are not many, and are inexpensive. Most of them are probably already in possession of readers of this article.

The extras to be purchased are, say, three pens made by Mitchell's, and obtainable from any artists' supply shop. They are called poster pens, numbered L.13, L.14 and L.15. These will be found large enough for general purposes, and cost three pence each.

"Indian ink" also obtainable from the artists' supply shop, gives the finest

results, but ordinary or coloured inks can, of course, be used. A good black is generally best, although, if it is likely to be too strong for a title, the ink can be watered down until the lettering is grey.

The usual failing of amateurs is that they are inclined to be too ambitious in their endeavours, and make the lettering too elaborate or ornamental.

In the example reproduced on this page is a type allowing of freedom after a very little practice, and can be done with the pens mentioned above. In carrying out this kind of work the muscles of the wrist and fingers should not in any way be tensed, or the mobility of the pen will be affected. The position of the pen will require very little variation from that in ordinary writing.

The main stem or band of the letters will be formed by the boldest stroke of the pen.

Using the wooden guide described below.

A B C D E F G H I J K  
L M N O P Q R S  
T U V W X Y Z;  
a b c d e f g h i j k l m n o  
p q r s t u v w x y z.  
1 2 3 4 5 6 7 8 9 0:

The space between the letters is not equal by measurement, but is judged by sight. The ability to gauge these spaces comes only by practice. Notice that the letters V W are almost touching and that H I J K are only a half-letter space apart. By making comparisons between other letters and spaces one can form correct judgment of any other spacing that may be required.

Before commencing work one should mark lightly the essential guide-lines in pencil, though it is not necessary to mark out the exact shape of the letters. Small work, such as that under notice, is more or less free-hand. It is also necessary to mark lightly the position of letters or words to be used, either above the actual position of letters or in between the guide-lines for the top and bottom of letters. Practise on spare paper first.

Having marked out the work to be done, place a piece of paper under your hands to keep the work clean and unsoiled. With the colour on the right-hand side, and the pen loaded, but not too full, you are ready to start.

With full confidence and an average steady hand one should find it a not-too-difficult job to proceed free-hand; but if not it will be helpful to use a piece of very smooth wood 9 to 12 in. long,  $\frac{1}{2}$  in. wide and  $\frac{1}{4}$  in. thick. This is placed not too near the letter being done, allowing sufficient room for the third and fourth fingers to slide up and down on it with the pen held in the hand.

This is intended for the vertical lines or strokes only. It can also be used in placing the cross-strokes of the letters where needed, one end being held in the left hand just raised clear of the work, and the other end resting on the card, the pen being drawn along as when making an ordinary line. This is illustrated above.

It will be found easier to do this part free-hand, except of course lines of extra length. The letters with curves should be found fairly easy to do, as the pens almost make the letters themselves: they are ideal for the work.

# Autumn Activities AT

The general arrangement of a retouching desk. Note the white paper to throw light up through the negative. If the negative is on a film a piece of plain glass should be placed in the frame to support it.

Apart from the fact that there are many attractive outdoor subjects to photograph during the autumn and winter, the longer evenings will provide opportunities for the endless phases of

After the prints are washed they are passed through a bath of alum (10 per cent solution) for five minutes, and then given a final rinse in plain water.

amateur photography that can be conducted at home. In addition to indoor camera work, printing, enlarging, and lantern slide making (which are dealt with elsewhere in this issue), retouching the negative preparatory to printing, glazing

## Retouching

THE negative to be retouched, whether on a film or on a plate, must first be rubbed over lightly with retouching medium. This is best obtainable ready-made from a photographic dealer. Only a little is required, and it is smeared over the surface of the negative with a plug of cotton-wool and polished off. The surface of the negative is then ready to take any pencil work that may be necessary to improve it.

While special retouching desks with holders for negatives are obtainable from the dealer, and are best for the purpose, any makeshift frame, such as a printing frame, that will hold the negative in a similar manner to that illustrated, may be used. It can be propped up if necessary by books, etc., but the light must be reflected from a sheet of white paper up through the negative, so that all defects can be clearly seen. Obviously, a strong light should not be behind the operator or the image will not be clearly seen by transmitted light.

Most of the retouching, especially with portraits, will take the form of gentle stippling and dotting with a finely-pointed hard pencil to strengthen shadow tones and to increase the opacity of high-lights. A very light, caressing touch is best; hard lines and strokes are not necessary, and will spoil the work. Pinholes can be spotted out with a mapping pen, or a fine, pointed sable brush charged with water-colour. Opaque spots can be very gently scratched away with a sharp eraser or one of the special erasing nibs that are supplied for the purpose. In any case, the work should be done smoothly with the hand moving freely and without pressure. A trial print should be made to see whether the work is proceeding satisfactorily.

The same arrangement of retouching desk and light should be used when blocking out any part of negative with opaque paint.

The pencil should be held lightly and the retouching effected with a very gentle stippling action to build up density gradually where wanted.

To remove dark spots or reduce undesired high-lights a lancet-edged knife or nib is used as an eraser.

## Glazing

SMALL contact prints on gaslight and other gelatine-surface papers are generally improved by being glazed. This is easily undertaken by the amateur in the following manner.

To make sure that the prints will glaze satisfactorily it is necessary that the surfaces should be hardened. This is best done by soaking them for a few minutes in a bath of 10 per cent alum solution after they have been washed. They are then given a final rinse to remove the alum, and are taken from the dish of water and placed on a polished ferrotype plate. This is a highly glazed sheet of metal which is sold for the purpose.

An alternative is a sheet of well-polished glass. This should be first thoroughly washed with soap and water, then with plain water, and dried. The surface is then prepared by dusting on french chalk, which is finally polished off entirely.

After the prints have been placed wet on the polished surface the plate holding them is placed on a flat, firm surface, two or three sheets of newspaper are placed on top, and the superfluous water is firmly squeezed off. This is accomplished by using a rollersqueegee, which should work from the centre to the margins, and should be applied fairly vigorously, so that there are no air-bubbles left between the prints and the surface of the plate.

Finally, the plate is placed in a warm current of air near a fire until the prints are quite dry, when they should readily peel off with a highly-glazed surface.

Causes of failure are either prints not hardened enough or glazing surface not properly cleaned and polished.

The prints are taken from the washing water and placed face downwards on to a glazing sheet of ferrotype plate or glass that has previously been well cleaned.

Two sheets of blotting-paper or newspaper are placed over the prints and they are rolled down firmly with a roller squeegee.

The prints are dried by placing them in a current of warm air or near a fire until they peel off. The former is the better plan. If the fire is too hot or the prints are placed too close they may come off with uneven markings.

# for the Amateur HOME

the prints after they have been made, and trimming and mounting are activities that recur constantly at the present time of year. The notes on this page are intended more particularly for the less advanced worker.

Trimming a print with a right-angled trimming shape is necessary to secure square corners. A sharp-pointed knife should be used, and this should press lightly but firmly into edge of guide, as shown, when making the cutting stroke.

When dry mounting, adhesive tissue is first applied to the back in the centre, and after both the print and tissue have been trimmed together they are placed in position on the mount. The corners of the print are then lifted while the tissue is stuck to the mount with a touch from a hot spoon.

## Mounting

THERE are many methods available for the amateur for mounting prints. The first essential is to see that the edges are properly trimmed. They should be cleanly cut with a sharp knife, and the corners should be true right angles. For this purpose a right-angle cutting shape should be used, after the parts to be trimmed off have been marked.

The prints are best trimmed on a sheet of hard cardboard, but with practice it is possible to trim prints with a straight-edge on a sheet of glass. The trick of doing this successfully is to use only sufficient pressure to cut through the paper, but not enough to blunt the edge of the knife on the glass.

The simplest method of mounting is to affix the trimmed print by one edge only, or the two top corners, using a strong adhesive, such as "Seccotine," of which only a little should be smeared on. This will serve both for prints in portfolios or for those that are to be framed or shown under glass.

If, however, the mounted print is to be handled much it should be mounted all over. For this purpose one of the special photographic mountants obtainable from any dealer should be used. These are very adhesive and not too wet.

The print should be held face downwards on a sheet of paper by the finger-tips, and the paste quickly rubbed all over the back. Not too much should be used, as these pastes spread easily the more they are worked. The position of the print on the mount should be ascertained beforehand by pencil marks, so that there will be no delay in applying the print to the mount after it has been pasted. A sheet of clean paper is then placed over it, and it is vigorously rubbed down with the hand, rubbing from the centre outwards to the margins of the print. It should then be put under pressure until dry and flat.

The best method of mounting to produce a perfect surface is dry mounting. This is particularly suitable for glazed prints.

In this case a special adhesive tissue is used between the print and the mount. Heat is applied to soften the shellac in the tissue, and this adheres to both the print and the mount. Professionals use a dry-mounting press, which applies pressure and heat at the same time, but for the amateur an ordinary smooth-surface flat-iron will serve the purpose.

A piece of tissue larger than the print is first lightly applied to the back of the print by a touch with a piece of hot metal. An ordinary spoon that has been

The print is held face downwards on a sheet of clean paper and the mountant applied quickly and evenly with a stiff brush, working out from centre to edges.

The correct position for print is previously marked on the mount by pencil dots. The pasted print is neatly laid on the mount so that the two top corners touch the dots and does not need to be shifted.

A clean piece of paper is placed over the mounted print and the surface rubbed down with the hand, working from centre and paying particular attention to the edges.

A flat-iron heated by placing in a bowl of boiling water. When it has acquired the temperature of the boiling water it is correctly heated for dry mounting. The heat of the iron will dry it quickly when taken from the water.

The trimmed print is pressed down on the mount with the hot iron. A sheet of thin smooth paper may be used between the print and the iron if the surface of the latter is not perfectly smooth.

heated in a gas flame will serve the purpose. Just one touch is sufficient to make it adhere in one spot.

Both the print and the tissue are then trimmed together. The print with the adhering tissue is then placed in correct position on the mount, a corner of the tissue is lifted, and it is fixed in position with another touch of the hot spoon.

The flat-iron is heated to a correct temperature as shown in the illustration, and is applied to the print with a fairly heavy pressure and not moved about, the operation being conducted on a flat, firm surface. If the face of the iron is not smooth and polished a sheet of paper should be placed between it and the print. As each part of the print receives the pressure of the hot flat-iron the shellac tissue melts and the print adheres.

# The Perfect Lantern Slide

This article deals with some points concerning the making of slides which will be of interest to many readers entering "The A.P." Lantern-Slide Competition.

THE perfect lantern slide is a delight to any keen photographer, whether viewed in the hand as a miniature transparency, or projected in its full beauty many times its original size.

Provided that the negative is a good one, and that the subject is well arranged within the picture space, it is not a difficult matter to produce an entirely satisfactory lantern slide.

## The Negative.

It hardly seems necessary to point out that the negative must be free from any defects of a mechanical nature. If pinholes are present they should be carefully spotted so that they are almost invisible in the negative and require no work on the slide.

The negative must be well exposed, and developed so that all the gradations of the original subject are shown. There must be no part so dense as to be unprintable, and equally there must be no area so clear that there is no hint of an image.

It is possible to remedy any excess of density in the negative by the use of a lantern plate of softer type, provided that the general character of the negative is good.

## Contact, Reduction or Enlargement.

The photographer who uses a miniature camera will have to enlarge his negatives on lantern plates, as the contact image is too small for most purposes. The fact that the miniature camera user has constantly forced upon him the vital importance of good technique, should ensure that his negatives have all the qualities which go to the making of perfect slides.

The degree of enlargement is small, about two diameters, and this should not be sufficient to cause any loss of fine definition, if the focussing is done with care, and the negatives are of critical sharpness.

With regard to contact slides, the photographer who uses the popular  $3\frac{1}{2} \times 2\frac{1}{2}$  size will find that most of his negatives are suited to contact printing, especially when only a part of the negative represents the actual subject. Slides from larger negatives may be made by reduction when most of the subject is wanted, or by contact when only a part makes a good composition.

Making slides by reduction calls

for a suitable camera of fairly long extension, as the process consists essentially of copying the negative (illuminated evenly by transmitted light) on to a lantern plate in the camera. An old quarter-plate camera can frequently be picked up very cheaply and is ideal for the purpose. Some enlargers have special adjustments and extension that permit lantern slides to be made by reduction.

Care should be taken to see that the subject is not too large on the lantern plate. For example, portraits, and especially head studies, should not occupy the full size of the plate, or the result when projected will appear on too large a scale to be satisfactory, and suggest the heads of monsters.

The same applies to flower and similar subjects. On the other hand, landscape, architecture and similar subjects gain when seen upon a large scale.

## Density.

A good lantern slide when viewed as a transparency against the light will be found to have plenty of brilliance and contrast. There will be tone in the highest lights, and the deepest shadow will be sufficiently transparent to transmit some light. The slide which has clear film, and shadow so deep that the light cannot penetrate, will appear horrible on the screen.

As a rough-and-ready guide the slide may be placed upon a sheet of printed paper, when it should be possible to read the type through the deep shadow. The best way to view slides in the hand is against an electric light covered with an opal shade.

Many slides are weak and flat through over-exposure of the plate and too short a development.

## Developers.

For black tones the following single-solution developer is recommended:

Hydroquinone ..	80 grs.
Sodium sulphite (cryst.) ..	1 oz.
Potassium hydrate ..	80 grs.
Potassium bromide ..	10 grs.
Water to ..	20 oz.

Do not use at a lower temperature than 65° Fahr.

For warm tones use "Chloride" or "gaslight" lantern plates and employ the special developer, the formula for which is always printed on the lid of

the box; but if rich sepia tones are wanted on the faster "black tone" plates use the following:

A. Pyrogallic acid ..	1 oz.
Sodium sulphite (cryst.) ..	4 oz.
Water to ..	20 oz.
B. Ammonium carbonate ..	480 grs.
Potassium hydrate ..	360 grs.
Ammonium bromide ..	240 grs.
Water to ..	20 oz.

One dram of A and B are taken and water added to make one ounce. Increased exposures are necessary with this formula.

The secret of success is in the use of a plate suited to the needs of the negative in the matter of contrast, correctly exposed so that development can be carried as far as it will go without excessive density.

## Defects.

One of the most common causes of defects in lantern slides is dust upon the negative or the lantern plate, which results in a crop of pinholes. It is not an easy matter to remove them, and prevention is so simple that it is far better than cure. This is a matter of a dust-free dark-room, a clean printing frame glass, clean negatives and dishes and filtered solutions.

It is better to make another slide than to attempt spotting. If this must be done the best tool is a mapping pen and liquid indian ink.

A defect often seen in lantern slides is light corners, due to uneven illumination when making the exposure. This has a very bad effect upon the subject, and the corners of the picture should be darkened down by shading the rest of the negative.

Make sure that the picture is, as near as possible, in the centre of the slide. This ensures a central picture on the screen.

Care should be taken over the masking, the mask of the slide corresponds to the trimming of the print. The masks should be truly rectangular, and domes, cushions and "fancy" shapes beloved of the commercial slide-maker of the last century avoided.

Lastly, the cover glasses should be clean. Many photographers use wasted slides for this purpose, and it is very important that not only should all traces of the film be removed, but also the glasses should be brilliantly polished.

## EXPOSURE METER

for Still and Cine Cameras

# Simplifies

AND ENSURES

# Correct Exposures

*Enthusiastically Acclaimed by Photographic Press*

How can you be sure of correct exposure? You can be accurate every time, and with the utmost simplicity, now that a British manufacturer has produced a perfect exposure meter. The "AVO" photo-electric Exposure Meter gives instantaneous indication of correct exposure, without the need for troublesome and time-wasting calculations.

Direct readings of shutter speeds and stop values are given over widest limits with a simple setting for film or plate speeds.

Exceptional sensitivity variable to suit all conditions of light, gives extreme accuracy in weak light.

All extraneous light outside the picture angle is excluded from the light-sensitive cell.

Instantaneous indication assists best results in rapidly changing light.

Freedom from calculations and crowded tables is combined with absolute dependability and compactness for the pocket.

### Exclusive Features giving simpler and quicker indication of Accurate Exposure

- A photo-electric meter with entirely unique sensitivity and accuracy.
- British Made and backed by the fame of "AVO" precision measuring instruments.
- Simplicity and rapidity of use. No calculations. No crowded tables.
- Universal—for "Still" or Ciné cameras.
- Readings uninfluenced by sky or other extraneous light.
- Compact—light in weight. Size only  $3 \times 2\frac{1}{4} \times 1\frac{5}{16}$  inches.

## NOTES AND NOTIONS FOR THE LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

### SOME AUTUMN OPPORTUNITIES.

**Y**EARS ago the amateur photographer, however enthusiastic, associated autumn with a slackening down of his work. Very often, about this time of the year, he "packed up." Not so to-day. Autumn days, and nights, bring their special opportunities for interesting and striking work, and modern apparatus and material enable us to take full advantage of them.

The days shorten, but the long evenings make it more convenient to treat outdoor subjects by artificial light. This is always attractive, and such subjects are much easier to deal with than they used to be. Exposures have been reduced from minutes to seconds, and even fractions of a second. Lighting is brighter and more general, and the rapidity of lenses and sensitive material has made the inclusion of figures possible. Snapshots in the theatre are no longer an optimist's dream, but an accomplished fact.

But it is of autumn photographs by daylight that I wish to say a word or two. On many days there

*The Storm Cloud.*

will still be bright sunshine, but it is not so brilliant as in the height of summer. This is an advantage rather

than otherwise. The contrasts of light and shade are present, but they are not so extreme, and are therefore easier to register in the negative, and to reproduce in the print.

On many days, too, the air is misty, especially early and late in the day, and every "pictorial" photographer knows how extremely valuable this condition may be. In securing what is rather curiously called "atmosphere" the beginner must be on his guard. I know that he often holds the opinion that because the rendering of some subjects is improved by using a filter on the lens, therefore all subjects will be improved by such a method. This is by no means the case. A filter will very often "cut out" the atmospheric effect that it is desired to record, and it is often the case that under such conditions an ordinary plate will answer better than anything else.

When it comes to the familiar "autumn tints" in woodland and field, it is another matter. Then orthochromatic and even panchromatic material will certainly be called for, and

*The Quay, Poole.*

a filter—yellow or green—may be a great help. The same applies to the photography of the many beautiful flowers that come with the autumn.

In the present months, too, fine sky effects are common, and it is this point that the illustrations are intended to emphasise.

The view of the quay at Poole would be far less satisfactory if the sky had been blank. The rolling September clouds have given it added interest. The negative is ordinary flat film, not panchromatic, and the print is perfectly straight, and on normal bromide paper. The light on the white hulls of the boats made these the brightest parts of the view, the clouds, even at the brightest, being yellowish.

In the stormy sky off the Isle of Wight the original print shows realistic tones everywhere. There is sufficient detail in the land seen against the light, in the dark cloud and its shadow on the sea, and in the brighter passages of the sky. This also is a straight print from a straight negative, and could have been taken with any camera that would give  $1/50$ th of a second at  $f/8$ .

"Stonehenge" is one of a series of twelve I took in about a quarter of an hour, and is by no means the best. The sunlight was intermittent, and the rapidly changing autumn sky enabled me to obtain a great variety of effects. On a cloudless summer day a couple of exposures would have satisfied me as regards number, but not as regards results.

Stonehenge.

I find no difficulty in retaining printable skies. The more contrasty they are the better, but even delicate effects can be recorded with reasonable care. A filter may or may not help. I think the great secret of "keeping" skies is to avoid over-development; and the exposure should have been such that by the time the sky tones are of the right density there should be sufficient tone and detail elsewhere.

Negatives do not require to be as strong as in the days of albumen paper and P.O.P. Many of my old

negatives will give nothing but blank paper skies in a bromide enlargement. They were over-cooked. A good many modern D. & P. people, unfortunately, will likewise over-cook your negatives if you give them the chance; and then good-bye to your skies.

There is a special opportunity this autumn season for recording the wonderful colours seen at no other time in the year. The Dufaycolor film has given us chances that we have never had before. But that is too great a matter for the fag-end of an article.

W. L. F. W.

## Fulfilling those Holiday Promises

HOW many amateur photographers, however highbrow and pictorial they may be, can spend a holiday without making many exposures on what will be purely domestic records, followed by promises of a "print of each"? Alas! how often does our friend wait in vain for his prints, the task of making them being relegated to odd moments which may never crop up. I find it better to set aside an evening or two, soon after the holiday negatives have been developed, to "polishing off" all outstanding record snaps, thus easing my conscience and enabling me to concentrate on serious work later.

Contact prints are usually all that is required, and here let me say that I never employ gaslight paper for large batches of prints; it is too slow in exposure and too quick in development. Bromide paper is far better. It can be obtained in any size, grade and surface, and is most economical in gross lots. For  $3\frac{1}{2} \times 2\frac{1}{2}$  I use commercial postcards cut in two, an easy job with a razor-blade trimming-knife, at a cost of 100 postcards for 3s. All the big firms make

these inexpensive cards, and their quality is very good.

Bromide printing must be carried out in the dark-room, and a candle may be used for exposing. This is a nuisance, and a low-powered electric bulb which can be switched on and off is better.

Negatives are grouped, normal, hard, or soft, and three grades of bromide paper are used, generally one night's printing to each grade, to avoid confusion. Developer is mixed to the maker's formulae (I use M.Q.), and a  $12 \times 10$  dish used for acid hypo.

Where a large number of prints are to be made from one negative, a test is made in strips, as usual, and the correct exposure ascertained. I find six seconds an average time in normal conditions. The required number of sheets are placed face down in a box, covered with a card. They are quickly printed off and placed in another empty box. This is better than developing each print as made, as the hands are dry and stains are impossible.

A fairly large dish, say  $9 \times 7$  for  $3\frac{1}{2} \times 2\frac{1}{2}$  prints, enables six or eight prints to

be developed together, and as bromide paper takes about 3 minutes to develop, no difficulty will be experienced. The prints are submerged face up at intervals of twenty seconds or so, so that after the last has been put in the first is almost ready to withdraw; the other hand rocks the dish slightly to agitate the developer. A rinse, and the usual fixation and washing complete the job. I can make forty good technical prints in an hour by this method.

For washing, I find two  $15 \times 12$  or larger dishes to be satisfactory, changing the water every five minutes for eight changes.

Where the number of prints per negative required is small, it is easier to develop as exposed. My procedure then is to expose one print, immerse it in the developer, rock the dish, then load the frame and expose another, and so on, until the three minutes have expired and the first print is developed fully. The remaining prints are then developed out and placed in the fixing bath; and the process repeated with the next batch.

A. T. BAILEY.

# Points on Slide Making

## for Beginners, by RICARDO

Lantern slide making is a fascinating branch of photography that should be tried by all keen beginners.

### Exposing, Developing and Fixing

**B**EGINNERS who can make a satisfactory gaslight contact print need not hesitate to make a lantern slide, as the two are similar in processing. The difference being that one is on paper and the other on glass.

Lantern plates are made in one size only,  $3\frac{1}{4} \times 3\frac{1}{4}$  in., and are obtainable in different types of emulsions, such as bromide and chloro-bromide, or gaslight; but the novice is advised to try the gaslight type first.

Any white artificial light can be used for exposing purposes, but the unexposed plates and the developing process should be kept in shadow, as in gaslight printing, to avoid fogging.

Take a plate and place it in a printing frame with the emulsion side in contact with the emulsion side of the negative. If the negative is on a film use a piece of plain glass in the frame to support it. Replace the back of the frame and the plate is ready for exposure.

The first exposure should be taken as a test for correct time. The remaining negatives should be grouped for densities, and their comparative exposures can be roughly estimated after the first slide is made. If the light used is horizontal, or vertical as shown in sketch, it is advisable to keep it always at, say, 2 ft. away. Exposure times will vary, of course, but 10 to 30 seconds can be taken as a rough guide, with an average single electric lamp.

The plate is now ready for developing.

Although almost any of the single-solution proprietary developers, such as Rytol, Certinal, Azol, or Rodinal will do, it is better to use the developer made specially in packet form for the slides used or as given in the formula on the slide box. The correct times for development are usually supplied with the plates.

After development is complete the plate is then rinsed in water and fixed in plain or acid hypo. When the "creaminess" has entirely disappeared it is ready for 30 minutes' washing. It should then be put in a rack to dry.

### Masking the Slide

**T**HIS is necessary in order to cut off unwanted portions of the slide showing on the screen, and must be done before the plate is bound. There are two ways of masking as shown in the sketch. The first is by using  $3\frac{1}{4}$ -in. strips of black paper gummed on one side and sold specially for masking and binding, and the other way is to use square pieces of opaque paper,  $3\frac{1}{4} \times 3\frac{1}{4}$ , with the necessary aperture cut out by a knife. Of the two, the first method is the more satisfactory. The masking must be made on the emulsion side. Passe-partout can, of course, be used instead, but do not over-moisten the gum as it may ooze out at the edges and show on the screen.

### Binding the Edges

**A**FTER the plate is masked it is necessary to bind it up with a piece of clear glass of the same size for protection. This cover glass should be cleaned and placed on the masked side and the edges of both glasses bound together.  $3\frac{1}{4}$ -in. strips of black gummed paper are the simplest to use for this purpose. Two opposite edges should be bound first and then the remaining two edges complete the process. Only one strip of paper should be used on each edge and any protruding pieces cut off. Although a firm hand is needed to avoid creases or folds in the binding, do not use too much pressure as the glasses are thin and easily crack, particularly in the first stages of binding.

### "Spotting" and Titling

**T**HE two white spots seen in the right-hand sketch must always be added to the finished slide. They act as a guide for correct positioning in the projector carrier. They should always be at the top, and on the side which faces the eyes when the picture is seen the same way it is intended to be projected on to the screen.

Titles should never appear on the screen but, if used, should be stuck on to the same side as the spots, as shown in the illustration. Always keep the plate boxes for packing purposes as they prevent the slides from sliding about and scratching each other.

The finished slide.

# The London Salon of Photography

Now open at the Galleries of the Royal Society of Painters  
 in Water Colours, 5a, Pall Mall East, London, S.W.1

## SECOND NOTICE.

THE general effect of this year's Salon that will strike the visitor on entering the gallery is one of brightness and vivacity. This is due partly to the brilliancy of the prints and their arrangement, but also, in a measure, to the subject matter depicted. A great number of the pictures are definitely joyous in character, with a suggestion of action that is both attractive and satisfying.

In the previous note on the Salon, comment was made on the extraordinarily high quality of the prints as a whole this year. There is scarcely a picture in the show that the most capricious critic will find fault with on technical grounds, and there are many of superlative excellence pictorially.

There is little doubt that the progress that has been made in photographic materials during the past few years is responsible for much of this. The use of panchromatic material and modern printing processes is evident on all sides, with the result that if a photographic exhibition of a decade or more ago could be staged to-day it would seem very dull and tame in comparison, from the point of view of technical presentation.

### British Work.

Among the British workers who have notable prints on the walls, in addition to those mentioned in the previous notice, reference must be made to the prints by John H. Ahern, who has a liking for odd viewpoints, and Walter Bird, who shows prints of fine quality. His portraits in particular striking a very high mark of excellence both in arrangement and presentation. S. Bridgen has a good architectural subject with figures, and H. Burdekin is well represented with a strong picture of machinery and another, a breezy outdoor subject.

J. Capstack's pugilistic study recalls his last year's success, and Keith Dannatt gives us yet another of his dual portraits of gipsy types. T. Erik exhibits an excellent piece of still-life work, and Noel Griggs shows vigour in his treatment of the nude.

Edward Haigh has some good figure work with fine print quality, and Walden Hammond again exhibits cleverly lighted figure studies, showing imagination combined with pictorial and technical skill. E. Chambré Hardman's work is welcome for its

delightful quality, and W. Harrison has two remarkably fine head studies in Gevaluxe that compel attention.

E. Heilmann's quaintly chosen subjects are always well done, and this year they are very decorative. B. Leedham remains constant to his nude studies, and Arnold Longman follows the lead of Herbert Lambert with great success.

Rosalind Maingot is only represented by one picture this year—a very dainty nude, and E. J. Mowlam has only one marine picture—a yachting subject. Yvonne Gregory has two pleasing figure subjects, and Mrs. N. Ralli has an example of her bromoil transfer that is less strong than usual. John St. Aubyn again finds expression in tiny bromoil transfers, but Fred Judge is not so well represented as in previous years. Paul Shillabeer has two attractive prints, notably the amusing animal study entitled "Where's George?"; and E. Snyder shows some vigorous figure work.

Walter Thomas shows yet another of his series of striking pictures of judges, and Maurice Turney is also well represented by portrait subjects. Lionel Wood makes a departure in showing miniature prints, and some strong colour work is exhibited by Madam Yevonde. Dorothy Wilding has a notable array of her characteristic figure work, and Challenor Woods has two strong figure subjects in rather a heavy key.

Other exhibitors whose prints are worth noting are Ismay Taylor—with one of the most compelling figure studies in the show: "Woman is Fickle"—Gilbert Adams, H. Vandyk, John Erith, G. Fayer, Maurice Beck and Walter Benington.

### Foreign Work.

Foreign pictorial photography is well represented at the Salon this year. A particularly strong group of pictorialists in Budapest, headed by D. Ronay, have sent some fresh and striking figure work, most of which is presented on glossy bromide paper. These, when seen under glass, look particularly rich and satisfying in quality. Among the workers from this part of the world are K. Szollosy, L. Szekely, G. Seida, R. Balogh, H. Kalman, T. Koch and E. Lienton. In each case the prints have strong individuality.

From Holland, M. F. J. Coppens repeats his success of last year with another series of fine head studies, treated in a broad and rugged manner that suits the subjects. Jan de Meyere, of Stockholm, again shows his mastery of black and white for figure studies of curious charm.

Italy is well represented by a number of workers—notably Giulio Cesare, with his very personal renderings of snow scenes, and I. Bertoglio, who relies on design for effect, while M. Ermanno, E. Aonzo, F. Bender and F. Maraini also show effective pictures.

J. E. Borrenbergen, M. Broquet, P. Cools and R. Dufour, in addition to Leonard Missonne and Pierre Dubreuil, already referred to, make a good showing of Belgian work.

From Germany characteristic prints are on view by A. Eisenstaedt, Princess Eberhaed Arenberg, and Otto Martens; and from Czechoslovakia are exhibits by Dr. J. Lauschmann, B. Gottlieb and F. Drtikol.

### American Work.

Among the American work special note should be made of that shown by P. Douglas Anderson, Forman Hanna, with a new batch of outdoor nude studies, A. Fassbender of New York, F. R. Fraprie of Boston, and W. C. West, A. J. Krupy, D. V. Dorin, George Henry High, O. J. Berg and Max Thorek of Chicago. E. Alenius, Jack Barsby, Louis Fleckenstein and R. A. Officer, also have notable exhibits.

The Japanese workers from the United States and from Japan again show original ideas in picture-making. Among these are T. K. Shindo, M. Shimotsusa and K. Shimojima, K. Hashimoto, T. T. Hu, K. Wakasa, Hiromu Kira, K. Matsuki and S. Nakagawa. Their work is always worth careful inspection.

Will Till of Johannesburg, J. Vanderpant of Vancouver, E. Welinder and Fred Flodin of Sweden, P. Klapwyjk and S. Zoetmulder of Holland, Pierre Adam of Paris, S. J. Kharegat and F. R. Ratnagar of India, Monte Luke of Sydney, and J. B. Eaton of Melbourne, Dr. A. Katscher and A. Karplus of Vienna, F. Mora Carbonell of Spain, Oscar Beire of Switzerland, Josef Augyal of Hungary and Jean Drosd of Poland, all have prints exhibited that call for attention.

# CHLORO-BROMIDE PRINTING

By E. B. SHAW.

The steadily - growing popularity of chloro-bromide papers for exhibition and other work makes the following practical article of considerable topical interest.

CHLORO-BROMIDE papers are capable of giving—with the right sort of negative—prints of great beauty, ranging in colour from a warm or brownish black to a rich brown.

The first essential for successful printing on these papers is a negative of the right kind. Chloro-bromide emulsions give a long scale of gradation of tones. Subjects of high contrast—or low contrast—with *very few* intermediate tones between the darkest and lightest tints are not suitable for these papers.

The speed of chloro-bromide papers is between that of "gaslight" paper and ordinary bromide paper, but different makers produce papers of considerably different speeds, and characteristics, i.e., length of exposure required and time of development to obtain a certain colour, and the amateur will do well to choose one particular brand and stick to it until he has mastered it.

## A Test Exposure.

Having produced a negative of the right type and chosen a chloro-bromide paper, we may now proceed to make prints. A yellow safelight should be used. A test print should first be made as follows: Place a piece of paper in contact with the film side of the negative in the printing frame and place the latter covered with a piece of card about 3 feet from the light, which may be gas or electric. A 25-watt pearl electric lamp is useful, as one does not get shadows and images of the wires thrown across the printing frame.

Uncover the whole of the negative and give 5 seconds' exposure. Cover up about one quarter of the area and give another 5. Repeat, covering up another quarter and give another 5 seconds, then repeat and give a final 5 seconds.

The paper will then have received four exposures in strips of 5, 10, 15 and 20 seconds.

The test piece, being exposed, is now placed in the developer, which should be between 65–70° Fahr. This is important, because good tones are not obtainable on these papers when the developer is cold. 68° Fahr. is about the best temperature at which to work.

The test piece is developed for 2½ to 3 minutes, according to the brand of paper used. The tone aimed at here is a warm black. After development, the paper is rinsed for 2 or 3 seconds in water, and then placed in the fixing bath. All solutions used should be as nearly as possible at the same temperature.

The following formulæ will be found satisfactory. At the same time it is always advisable to adopt a formula given in the instructions issued with the particular paper.

	Avoir.	Metric.
Metal .. ..	10 grs.	1 gm.
Hydroquinone ..	40 grs.	4 grms.
Sodium sulphite (crys.) ..	600 grs.	60 grms.
Sodium carbonate (crys.) ..	450 grs.	45 grms.
Pot. bromide ..	30 grs.	3 grms.
Water to ..	20 oz.	1,000 c.c.

Use you dilute with an equal volume of water.

The fixing bath is made as follows:

	Avoir.	Metric.
Hypo .. ..	3 oz.	130 grms.
Potassium meta-bisulphite ..	½ oz.	22 grms.
Water to ..	20 oz.	1,000 c.c.

The time of fixing should not exceed ten minutes. The best practice is to use two fixing baths and give 5 minutes in each.

After fixing, the test piece should be examined by daylight, and it will soon be recognised which exposure is nearest the correct one.

## Judging Results.

It may be that none of the exposures suffices. If this is the case then:

1.—If none of the exposures is enough, repeat at one-half the distance from the lamp—i.e., at 1½ ft.

2.—If all the strips have received too much exposure then repeat at double or three times the distance from the lamp, viz., at 6 or 9 ft.

The ideal method is to use *fresh* developer for each print. As a rough guide 1 oz. will be sufficient for a 2½ × 3½ or ¼-plate—using a ¼-plate dish, or 2 to 3 oz. for a ½-plate—in a ½-plate dish. Larger sizes in proportion, but in any case the same developer should not be used for more than two or three prints.

After fixing, prints should be washed for half an hour—thick paper one hour—in running water.

## Variations in Colour of the Print.

Suppose a print with a warm black image was obtained with 10 seconds' exposure and 2½ minutes' development at 68° Fahr., and it is now desired to obtain a print from the same negative but with a much warmer, i.e., a brown, image.

Then, keeping the distance from lamp to printing frame the same, give five times the exposure, viz., 50 seconds,

and, using fresh developer, also at 68° Fahr., develop for one-half the original time, i.e., 75 seconds. This will serve as a useful guide for a first attempt.

Still warmer colours may be obtained by further increase of exposure and curtailment of development, but there is a limit beyond which the colour of the print turns out a rather dirty yellow-brown and the quality of the image is lost.

Precisely the same procedure applies to the making of enlargements as to contact printing. Test exposures on the enlarging easel should first be made in a similar manner. These will, of course, be much longer, and in some cases may extend to minutes, according to the degree of enlargement and the light.

## Obtaining Cold Tones.

A final word with regard to obtaining *cold* tones of a rather distinctive quality on these papers. Use the following formula and regulate the exposure so that development is complete in 2 to 2½ minutes at 68° Fahr.

	Avoir.	Metric.
Amidol .. ..	50 grs.	5 grms.
Sodium sulphite (crys.) ..	500 grs.	50 grms.
Pot. bromide ..	2 grs.	0.2 gm.
Water to ..	20 oz.	1,000 c.c.

When cold tones are required choose a chloro-bromide which has a *white* base, otherwise the point in obtaining a *cold* tone is lost. With the amidol formula the cold black image obtained is of first-rate quality, and especially suited to subjects like snow scenes.

The following summary will serve as a useful guide to successful results in the manipulation of these papers:

## Summing Up.

1.—See that the negative is of the right kind, i.e., possessing a long scale of gradation.

2.—Keep to one make of chloro-bromide paper.

3.—For consistent results use fresh developer for each print.

4.—Keep all solutions at the same temperature—68° Fahr. is the best.

5.—Fix each print for the same length of time—never more than a total of 10 minutes. Use two baths for 5 minutes each if possible.

The image of a chloro-bromide print consists of exceedingly finely divided silver, and a long immersion in a fixing bath, especially an acid one—may possibly tend to remove some of the silver in the high-lights, and thus impair the quality of the print.

# WINDMILL

By CHRISTOPHER WENLOCK.

in the meadowland or on a solitary hill ; allowing the photographer to choose his position, according to the light or outstanding cloud formations, and to select the particular aspect he favours ; so long—and this is an important point—so long as the sails are facing into the picture. Full-face is, of course, least effective ; but, apart from these considerations, the artist has the choice of many angles from which to view the structure.

The mill on Chailey Common in Sussex has just been rebuilt, its upper portion, carrying the sails, having been blown down in a gale in 1929. It has been repainted ; and the effect of the white sails against the blue sky is very arresting ; a colour filter being used to obtain the dark tone value of the sky.

Not often does a mill stand in close proximity to a river ; but at Rye there is a good galleried mill beside the Tillingham stream, where the crops and riverside assist in the making of a picture.

In Sussex a mill has been built upon the great barn in the centre of a farmstead. This is at West Blatchington,

*At the Top of the Hill. A derelict Peg-and-Post Mill.*

THE windmill provides an excellent outdoor autumn subject for the photographer. Graceful in form, its presence in a scene adds a pleasing *motif* for a picture. Moreover the photography of windmills has a peculiar value, now that these memorials of the past are so quickly disappearing.

It is reckoned that two hundred years is the average life of a wooden mill ; and it is this mill that is the most picturesque. Almost all our wooden mills are to-day at, or beyond, the age limit. Some have been repaired and their timber-work renewed, investing them with a new lease of life ; but many are derelict beyond repair.

A large number of mills stand out apart from competing objects, either

*The Clayton Mills, Jack and Jill, near Brighton.*

# Photography

Although the picturesque windmills are gradually disappearing, there are still many remaining to be recorded by the camera, as this article shows.

near Hove; and some very excellent subjects may be found when farm vehicles, either horse-drawn or idle, are about the premises.

If a perfect mill in its resplendent coat of paint has an appeal, then from the artistic point of view the weather-beaten and decrepit mill has an even greater attraction. One such mill, until recently, stood near the road at Ashurst. It was a peg-and-post mill, one of the oldest in the country, and it succumbed to a gale only a few years back.

Perhaps most familiar of all our southern mills are the two standing side by side on the Clayton hills near Brighton. "Jack and Jill" they are named, though neither seems likely to emulate the exploits of their prototypes. "Jill," the smaller, white mill, has already accomplished more than her share of travelling, for she was drawn by eighty yoke of oxen from a position on the Dyke road to the Clayton hills in 1828. "Jack" is now inhabited as a dwelling-house; and both mills are unlikely to suffer depreciation.

The cramped nature of the interior of a mill renders satisfactory photography almost impossible, and one must be content with the external view; but there are such large and varied possibilities that no one need fear the subject will be overdone.

*Blatchington Mill.*

*The restored Mill on Chailey Common.*

*From the other side of the Clayton Mills. See Fig. 2.*

The photographer can use any type of snapshot camera for mill pictures. He should choose a sunny day with fine clouds for preference, and on such days—with modern fast pan. film or plates—exposures of 1/100th sec. will secure good exposure even with the sails revolving. For close-ups and "new angle" pictures the sails should be at rest.

It is to the advantage of the picture-maker that it is customary to set the sails in the position of St. Andrew's cross when work is finished. Before commencing work, however, the old millers always set them horizontally and vertically, in a position known as "Miller's Glory," which was regarded as assuring good success from the day's working. This is only one point from the lore and traditions of windmills. There are others as interesting as the subjects themselves.

**T**HERE is no reason why negative making during the autumn and winter months should be confined to daylight exposures only. Opportunities for seasonable subjects should, of course, be grasped whenever possible; but apart from these, the photography of artificially illuminated subjects indoors affords a considerable amount of pleasure to those who attempt them, and keeps the interest in photography alive.

There are, unfortunately, many dull days in autumn when outdoor work is impossible, and the amateur who is keen to make pictures realises that artificial light, used in conjunction with modern high-speed films and plates, renders the production of good figure studies a matter of ease and certainty at any time of the day or evening.

Within the last few years quite a number of highly actinic lighting outfits have become available which practically revolutionise indoor photography, particularly electric lamps possessing high power in voltages for plugging into any ordinary fitting. Another type, the "Sashalite," provides opportunity for an instantaneous flash at any predetermined moment. A fraction of a second has indeed ousted the necessity for longer exposures.

These lamps are, however, somewhat expensive, and many enthusiastic workers continue to use flashpowder. Handy and easily ignited, its brilliant flash can be so much under control that results are equal to the best daylight exposures. Superior modelling and print quality are secured by the employment of a diffusing screen of wet, or fireproof, butter muslin placed well in front of the light, and a reflector on the shadow side. Flashpowder involves no danger if too close proximity to curtains

## A Note on Indoor Figure Work by FLASHLIGHT

By Harold G. Grainger.

*A Fireside Group by Flashlight.*

or other furnishings or ceilings is avoided.

There are several excellent flash-powders on the market, and they are not expensive. The mixing of the two separately packed powders should take place just before use. The inclusion of a metal scoop enables a definite quantity of the admixture, ascertainable from the instructions enclosed, to be used for each exposure. As with other illuminating

methods, practical devices, as inexpensive flashlamps, can be purchased for securing instantaneous ignition precisely when desired.

By using one of these handy flashlamps held fairly high, to one side of the posed model, but not within the range of the lens, and a white reflector to lighten the shadow side, practically any form of modelling can be achieved with a portrait or figure subject.

For firelight effects, similar to the example reproduced, no special apparatus is required; ignition is obtained by simply placing the necessary amount of powder, twisted in tissue paper, on the fire at the opportune moment for exposure. As the smoke, inevitable with all flashpowders, finds an outlet chimneywards, further exposures can be made right away. The camera should, of course, be on a firm support—a tripod or small table, for instance.

When all is ready, open the shutter as the wrapped flashpowder is put on the fire (in a small blaze for preference), and immediately ignition has taken place close the shutter. In this, as in all flashlight photography, the usual room illumination should be on all the time. Not only is eyestrain thereby avoided, but the actinically weaker lighting is definitely helpful to the quality of the rendering. A lens hood eliminates the possibility of fog or glare.

A useful tip in artificial light photography is to employ, where possible, light backgrounds or settings, as other things being equal the relative amount of flashpowder necessary for a subject in light tones is only one-third to one-half that required for one in dark tones. This is due, of course, to the unalterable natural law that light objects impress the sensitive emulsion much more rapidly than correspondingly dark ones.

# PICTURES by Novices

## SOME CRITICAL COMMENTS *on the Beginners' prints reproduced on the opposite page*

IN the collection of prints reproduced on the opposite page, it is evident, in every case, that the intention is to make a picture with the sky and its clouds as the principal theme. Taken on the whole, these efforts are very creditable, but the chief difficulty seems to lie in the choice of a landscape that, while not proving too assertive, has yet sufficient interest to justify its inclusion.

### **Landscape and Sky.**

Quite apart from the difficulty of obtaining a decent representation of a sky effect together with a landscape in which the tones are properly recorded, it is not easy to find a subject which is neither so insipid that it fails to support the sky, nor one that attracts so much attention that competes with it and destroys its significance.

In No. 1, "Lake Rotomahana," by C. M. Shadbolt, the sky, viewed as an item by itself, is satisfactorily recorded, but it does not attract and hold the attention as it should, first, because the interest of the landscape, with its forceful contrasts of tone, is too insistent, and, secondly, because it has scarcely sufficient space in which to display its attractions. The distant hillside is very dark; there is an intervening stretch of very light tone in the water; and, in the foreground, another passage of moderate depth.

On the other hand, the landscape, if the area of the sky were reduced, is not of a nature that could stand by itself. It is lacking in interest and its forms have little appeal. The only possibility, as far as can be seen, of making a picture in the vicinity would be by altering the viewpoint so that the landscape falls into a more harmonious arrangement; by deferring the exposure until the light on the water were not so assertive; and by including a greater proportion of sky.

### **Placing the Horizon.**

The crux of the matter is that the horizon is too near the middle of the print. In such circumstances, and assuming that both landscape and sky have a degree of attraction, neither can be regarded as the dominant factor as one or the other should. If it is intended to give the sky pride of place, it should be allotted the major

proportion of the picture space, and, even where the landscape provides the main attraction, it is usually better to keep the horizon below the centre line and refrain from introducing any forceful note in the sky.

Where the horizon is placed above the centre—and it is quite feasible—it is almost always necessary that the interest should lie in the foreground.

No examples of this type are included on the opposite page, but, in No. 4, "A Norfolk Sunset," by S. L. Hillebrand, the horizon line is very nearly central, and how much more the sky would appeal if the area of the foreground were decreased may be seen by trimming three-eighths of an inch from the base.

### **Pictorial Proportions.**

That brings us to the conclusion that, for this sort of thing, the picture should be divided so that about one-third of the picture space is given to the foreground or landscape and two-thirds to the sky.

No. 3, "Monsoon Weather," by W. B. Haslett, is of much about these proportions, but the rendering is open to the criticism that the foreground is utterly devoid of interest, and it is pretty obvious that the best part of the clouds—their tops—is excluded. What possibilities were there have been unfortunately missed, and something similar seems to have occurred with No. 7, "Storm," by Miss Beharrell. In this latter case, the pictorial proportions are well calculated, but the foreground is unnecessarily heavy—a concomitant of under-exposure—and the brightest part of the sky is along the top edge.

That will never do, for not only does it tend to direct the attention out of the picture, and is therefore undesirable, but it also indicates a failure to appreciate one of the fundamentals of arrangement in that the centre of interest must be well within the picture space. This principle applies, of course, to all kinds of subjects, whether they are composed of landscape and sky or not. The strongest positions for the centre of interest have been repeatedly indicated.

An improvement is shown by No. 8, "The Pap of Glencoe," by J. A. Stirling, where, though the distance

is comparatively dark, it does not seem so insistent as in No. 1, principally for the reason that the shapes are good, and they are more broken up.

### **Foreground and Distance.**

All the same, the immediate foreground is rather empty, and, from the loch side, it is possible that a bit of shore could be found that, while not asserting itself unduly, diversified that portion of the picture.

Those little blobs of clouds at top left, too, are inclined to be distracting, and, either a little earlier or later, it might have been found possible to avoid their inclusion. Clouds are always on the move, and they should be watched till a satisfactory arrangement presents itself.

"Clouds over Cornwall" (5), by A. R. C. Higham, is better still, though, as a matter of form, it would have been preferable if the brightest light in the clouds were more on the central portion rather than on those two eminences in the right-hand top corner. Apart from this, the sky is very fine, but the landscape has not quite enough of a suggestion of form and shape to live up to it. On the other hand, the sky in No. 6, "An Evening Sky," by Capt. R. Portal, is not of the same degree of attraction, but the landscape is much better chosen.

### **The Value of Half-tone.**

If the sky of No. 5 could be substituted for that of No. 6, and the suggested adjustment were made of toning down the offending corner in the former, a subject that would combine the best elements of both would be produced, and its attraction would be higher than either.

Turning to No. 2, "Sunset over Poole Harbour," by G. M. Emerson, this example seems to score over all the others, in the first place because its cloud forms are excellent and hang very well together, and, in the second, because the proportions are nicely adjusted and both landscape and sky have their due share of interest. The presence of a comparatively large amount of half-tone heightens the value of both lights and darks, and, besides, indicates a high level of craftsmanship. "MENTOR."

# OUR ILLUSTRATIONS

Notes on the Pictures reproduced on the Art pages in this issue.

**M**OST of the examples which are reproduced this week come from the two principal shows of the year—the London Salon of Photography and the exhibition of the Royal Photographic Society—and while the reproductions give a good idea of the choice and arrangement of the subject matter, they can only convey, in the nature of things, but a slight impression of their outstanding photographic quality.

This, in every case, is distinctive, and, of course, a real idea of it can only be gathered from an inspection of the originals. If at all possible, a visit to both exhibitions should be made, not only with the object of verifying this assertion, but also with the idea of finding out the scope and achievement of the best of the work of to-day. Both shows are open until the 12th October.

"THE DRUMMER," by E. LIENTON, which is on view at the Salon, is a case in point. There is no detectable flaw in the print despite a very considerable degree of enlargement, and it is characterised by a high degree of brilliance in the lights and a very pleasing luminosity and richness in the shadows.

From the pictorial standpoint, the picture is interesting as an interpretation of a jovial personality and as an expression of the modern tendency in band music of a certain type. It is reminiscent of a phase of life at the present time, and, no doubt, will find many admirers. In arrangement, it

has points of novelty, inasmuch as the rarely used diagonal form of composition has been adopted, and, notwithstanding the proximity and large scale on which the drum is shown, the importance of the figure is maintained as the prime centre of interest.

The placing of the head on the diagonal, despite its relegation to the top corner, endows it with sufficient force to attract and hold the attention, and the interest is further concentrated by the emphasis afforded by the strong leading lines of the arms on both sides. Everything seems to be designed with the idea of directing the eye to the top left-hand corner, and, as an arrangement, it is as novel as it is effective. In "WINDOW DRESSING," by FOSTER BRIGHAM, JUN., there is again a suggestion of newness, but this arises more from the nature of the subject material than from any departure from the normal run of compositions.

To make a picture with such unpromising objects demands a fair amount of ingenuity, and that it has been fully exploited is evident from the reproduction. The work is further notable in that it is the winner of the Dovel Le Sage prize for still life, and may be seen, in the original, at the R.P.S. It is undoubtedly intriguing, and, while the experiment could scarcely be repeated without inviting a feeling of imitation or a suggestion of too much of a good thing, for once in a way it "gets across" quite well.

As far as the composition is concerned, the centre of interest lies in the

neighbourhood of the point (1) where the lines of the two chains meet at opposing angles. The point in question derives emphasis from the fact that it forms the apex of an inverted pyramid, with its opposite side consisting of the more or less horizontal

line formed by the edge of the frame to which the chains are attached at the top. The form is indicated by the dotted lines in the sketch, which, no doubt, will make the position clear. Incidentally, it will be noted how the two patches of light, seen through gaps in the objects forming the subject material, balance each other, and, besides affording a needed relief, help to round off and complete the arrangement.

Of the many engaging studies of the nude, "MORNING," by WALDEN HAMMOND, is particularly noticeable on account of its unaffectedness and simplicity of statement.

It is very delicate and dainty, and the figure gains in impressiveness in contrast with the unstudied nature of the setting. The accessories are appropriate, and the implication of the title is well sustained by the splash of light catching the outlines of the model. With the source of light in advance of her figure, the remainder of her body is shown in shadow, but, nevertheless, there is an ample suggestion of modelling. The feeling of

roundness is preserved, and the probability is that either there was a secondary and diffused lighting or an efficient reflector was brought into operation.

The general impression created by this arrangement of the values is that the figure is admirably isolated; that she stands out very effectively against the background; and that both figure and setting are in tonal harmony. A greater degree of isolation might be inclined to invite a suggestion of harshness, or, at the least, tend to

dissociate the two elements, but the relationship between them has been very nicely judged and that suggestion does not arise. Possibly, a little more space above and below would not come amiss, but that is a point upon which opinions might well be allowed to differ.

Another tendency that might be mentioned is towards the employment of clear-cut definition as opposed to the diffusion frequently adopted in the past. It was noticeable in last year's shows, but, this year, it is decidedly more marked. In the examples so far discussed it is apparent, and "REAPING," by KALMAN SZOLLOSZ, is no exception, though, in this instance, differential focussing has been utilised to emphasise the importance of the principal figure. She is very sharply defined, and the print provides yet a further instance of the choice of a high-glazed printing paper.

Its attractiveness and quality are undeniable, and, again, the effect of sunshine *contre-jour* is delightfully rendered. The feeling of open air and space is not lacking, and, while these elements do form an æsthetic appeal that is by no means inconsiderable, there is a further alluring feature in

the very jolly and engaging expression displayed by the foremost figure (1).

Here, the main interest centres. Not only by reason of the human attraction which she exerts, but also on account of the fact that there exists the brightest lights, and that the head occurs at a position closely approximating one of the points formed by an intersection of thirds, does the figure claim principality, and well maintains it. The arrangement is extraordinarily strong, even if these factors alone are taken into consideration, but, in addition, the lines formed by the stalks of the corn, the sense of direction imparted by the remaining figures coming in succession, and the lines of the clouds all oppose the line assumed by the main figure, and by force of opposition vastly enhance her dominance.

The success of the arrangement must be attributed to an immediate and instinctive appreciation of the possibilities, and a corresponding quickness in bringing the camera into action.

A like facility in manipulation must also have been exerted in securing

"STOWING THE JIB," by F. J. MORTIMER. In this case it is probable that, besides having the possibility of movement in the figure to contend with, there would also be the difficulty arising from a viewpoint in motion.

Nevertheless, there is not the slightest sign of any blurring of the image, and, in fact, the print, despite its impressive size, bears further evidence in support of the tendency towards clarity in definition referred to above. The arrangement, here again, is astonishingly complete, and the sunshine—as the pictorial theme—is remarkably stressed by the presence of the well-caught figure. Its influence is greatest

on the white of his garments; it is only a little less in the light on the sail; and the close proximity of the dark of the hull to both lends point and emphasis to its value.

The way in which the subtle distinctions of tone, those of the figure, sail and sky, are rendered is a tribute to the perfection of the technique, and particularly noteworthy is the fact that, at the same time, there is sufficient modulation in the dark of the hull to suggest its roundness and form.

From the same standpoint, "YOUNG BITTERNS," by H. A. WALLACE, which comes from the natural history section at the R.P.S., satisfies all demands. Its quality is excellent, and, having regard to the nature of the subject, it is quite well arranged.

Truth of rendering is all important in a subject of this type, and, no doubt, it effectively serves its purpose in showing the birds in their natural environment. It might be said to illustrate their instinct for disguising their nest by simulating the appearance of its surroundings, and if any attempt were made to make them stand out better from their setting, it is probable—though the arrangement might seem to be improved—that the purpose of the picture would be defeated.

At all events, the difficulties of securing such a subject are tremendous, and, in the circumstances; it might be considered invidious, if not hypercritical, to draw attention to a feature that, in view of the primary intention, is of little consequence. The presumption is that it does what it sets out to do and does it extremely well, while, as far as the photography is concerned, it is eminently successful.

"MENTOR."

# How I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CCC.

Mr.

L. O. LEWIN.

From information communicated to our Special Representative.

"I usually takes me about two years to produce an exhibition picture. Incredible? Of course, but true nevertheless, as you will realise when I explain. The bulk of my negatives are made during the summer, and as soon as possible afterwards a collection of small prints is made from them. About a dozen of the most promising are then selected, and lantern slides made for the next exhibition of the photographic society to which I belong.

"That is the first test to which I put my selected negatives, and if, after the exhibition, I am still satisfied with

any of these, prints of about whole-plate size are made, finished and mounted, and presented at our 'criticism' evenings. If they survive this (the second test) I proceed to make my exhibition pictures. It will therefore be seen that between the time of making the negative and the appearance of the exhibition print nearly two years will have elapsed, our exhibitions being annual.

"So much for the procedure I adopt; now the means I employ. I possess three cameras, a quarter-plate stand (used chiefly for portraits at home, and as the front half of my enlarger), a  $3\frac{1}{2} \times 2\frac{1}{2}$  reflex, and a vest-pocket roll film (used only when it is really inconvenient to carry the reflex). The lens belonging to the reflex is used on the stand camera also.

"I seldom use anything but panchromatic cut films (which in my experience have many advantages over any other negative material), and these I use in a magazine holding twelve—my own invention. I develop with either Borax-M.Q. or amidol without bromide, by inspection (after desensitising), and aim for a thin negative, very fully exposed and suitable for enlargement with a condenser enlarger.

"I seldom make a contact print. Believing that the method of selecting a paper to suit a negative is expensive and uncertain (particularly as my favourite printing process is bromoil and bromoil-transfer), I always endeavour to make all my negatives suitable for printing on one type of paper.

"I have tried many papers for the bromoil process, but have found no magic in the word 'Bromoil' on a packet of paper, and have for several years now used exclusively 'Granville' with almost unfailing success. I treat it in no special way, using the old 'Wellington' formula for bleaching, short soaking (three minutes), and using a hard ink, afterwards (if necessary) re-soaking and re-inking with softer ink, perhaps several times. My transfers are made with the aid of the household mangle.

"With regard to the illustrations reproduced with this article, 'Trees and Clouds' is a bromoil, and is one of several attempts at the same subject, which appealed to me on account of the rather unusual lighting, and the pattern formed by the trees and clouds. 'Nose in the Glass' was a spontaneous shot out of doors,  $1/50$ th at  $f/8$ , August, S.S. panchromatic cut film."

(A further example of Mr. Lewin's work is reproduced on the opposite page.)

# The Royal Photographic Society

## 80th ANNUAL EXHIBITION

### *Second Notice: The Scientific and Technical Sections.*

WE have already referred to the Pictorial Section of the Exhibition of the Royal Photographic Society, now open at the Society's house, 35, Russell Square, and, briefly, to the other sections. These, which include colour photography, natural history, scientific and technical photographs, lantern slides and cinematography, will form for many visitors the most attractive part of the show.

#### **Natural History Photographs.**

Rooms 3 and 4 on the Second Floor, in particular, contain a great number of intensely interesting photographs, which show many of the applications of the camera. Nature photography, in particular, has a very large following of earnest workers, who are not only enthusiasts in natural history itself, but, from the evidence of the pictures exhibited, are possessed of great technical ability as photographers, and an amazing fund of patience in the production of their results.

Animals, birds, fishes, insects, plant-growth, and nearly every other thing that can be included under the general definition of natural history, are represented in this admirable little collection.

The bird photographs alone are worthy of special commendation, notably those by Oliver G. Pike and C. W. Teager. The latter's photographs of singing birds are particularly fine. G. K. Yeates, H. G. Wagstaff, Eric J. Hosking, H. A. Wallace, A. Gilpin, Ralph Chislett, H. B. Cott, Ian M. Thomson, G. B. Kearey, T. M. Fowler and A. V. Bibbings, all contribute bird studies that are well above the average. In most cases they have, in addition to fine technical quality, considerable pictorial attractions as well.

Animal pictures that are outstanding are shown by F. W. Bond (with a most attractive and amusing photograph of "Jubilee," the Zoo baby); L. J. Hibbert, with a fine lion study; E. S. Boswell; R. W. A. Burgess; H. M. Bell; John Markham, and Captain T. F. Emms. E. J. Bedford shows a series of plant-growth pictures which are attractively presented, and other notable prints in the collection are by J. Scott Thomson, R. Gorbald, Douglas P. Wilson, G. Bird, J. T. Salmon and Anne Jackson.

#### **Stereoscopic Work.**

In the same room are exhibited the stereoscopic photographs entered in the exhibition. These are shown in a series of inspection cabinets, and include both transparencies and prints. The stereoscopic transparencies are always more fascinating to examine than the prints,

and very rightly hold the attention of a great number of visitors, who enjoy inspecting them. A considerable number are in colour, and of these the exhibits shown by H. Wormleighton and Oliver A. Weiss are almost startling in their perfect rendering of the scenes depicted.

Other exhibitors in the stereoscopic section with good results are A. T. Mole, Dr. W. R. Grove, F. Aitkenhead, Arthur Hill, W. G. Halliday, J. Stuart Hills, F. P. Bayne, S. E. Dowdy, K. D. Sutcliffe, Miss M. Johnson, and L. E. Goodnight.

An exhibit of stereo radiographs of small biological specimens taken by "Grenz Rays" are exhibited by the Eastman Kodak Co. Research Laboratories.

#### **Technical Photographs.**

In the adjoining room on the Second Floor some striking specimens of record photography, high-speed and Press photography, and the technical applications of photography, are shown. The record photographs include some excellent prints of high technical quality, notably those by H. E. Illingworth, Dr. Paul Friede, J. H. Pledge (with a series of photographs of "sermon glasses"), and some notable exhibits by Arthur C. Banfield, showing examples of ciné strips used for television transmissions.

High-speed work is well illustrated with some examples made with an exposure of about 1/100,000th sec. by Harold E. Edgerton and Kenneth J. Germeshausen. News photographs by *The Times* and *The International News* strike the topical note.

Needless to say, several striking infra-red pictures are shown, and in the X-ray Section many interesting examples are on view, notably that exhibiting the progress of a barium meal, by G. Lovell Stiles. This was awarded the prize of £5 5s. offered by Professor G. Woodburn Morison.

In this section also is a series of photographs taken by polarised light, showing the remarkable differences achieved in the photography of a variety of subjects when this medium is employed, particularly when used in conjunction with colour screens. The Eastman Pola screens were used, and this exhibit, which is by Edwin A. Land, has been awarded the Hood medal.

In photomicrography a variety of subjects will interest the student, notably those by T. C. Dodds, showing pathological history of the brain, etc. This series was awarded the Rodman medal.

Other notable exhibits in this section are by E. F. Fincham, F. J. Pittock,

and William C. Davies, with a series of pictures of rock sections. Ranald Rigby, Thos. S. Beardsmore, A. V. Cobbet, also have interesting entries. F. W. Baker, C. J. P. Cave, G. Aubourne Clarke, and the Mount Wilson Observatory have some notable meteorological and astronomical photographs.

Aerofilms, Ltd., have some of their usual attractive pictures taken from great heights, and in this room exhibits by Ilford Ltd., and Ross Ltd., are of outstanding interest. The exhibits by the former show results on several recently introduced plates of remarkable character.

On the same floor, in Room 5, a number of trade exhibits are shown, which include those by E. Leitz, Ensign, Ltd., James A. Sinclair, Zeiss Ikon, and David Allan.

#### **Lantern Slides and Colour Work.**

In the studio on the Ground Floor lantern slides are on view. The collection, as usual, contains some very fine slides of high technical quality. All the best slide-makers are represented, including James Shaw, Daisy Snoddy, Robert Chalmers, A. W. S. White, W. A. Clarke, J. Dudley Johnston, C. Cecil Davies, J. E. Hall, G. K. Dannatt, George Haines, P. B. Dannatt, G. B. Kearey, Mrs. G. L. Killby, and H. F. Low. A series of natural history slides is also worth careful inspection, while the colour transparencies this year are better than on any previous occasion; they contain some remarkably good examples of the various colour processes now available.

In the Exhibition Room on the Ground Floor there is also a display of colour photographs on paper, some of which are attractive, but none of them reaches a standard demonstrating that definite progress has yet been made in this phase of colour photography in comparison with the transparencies.

Other exhibits by the trade are shown in different parts of the building, in the hall and on the staircases. These include exhibits by J. H. Dallmeyer, Ltd.; Kosmos Photographic, Ltd.; Kodak, Ltd. (occupying the whole of the Library on the ground floor, with a very comprehensive display); Elliott & Sons, Ltd.; Gevaert, Ltd.; Cinepro, Ltd.; Cinex, Ltd.; Pathéscope, Ltd.; Ilford Ltd. (with giant enlargements in the hall in addition to their exhibit in Room 4 and Dufaycolor transparencies in the Studio); Williamson Manufacturing Co., Ltd.; Agfa Photo. Ltd. (with ultra-colour films in the Studio); Soho, Ltd.; Lascelles & Co., Ltd.; and Iliffe & Sons, Ltd. (with a display of *The Amateur Photographer and Cinematographer*).

# NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

At the 23rd Annual Exhibition of the Professional Photographers' Association, now open at Prince's Gallery, Piccadilly, 700 examples of portraiture and figure studies by 157 British photographers are on view; several attractive groups have been arranged, notably "The Seven Ages of Man," "The Seven Stages of Beauty," and "When to be Photographed." A number of portraits of celebrities are exhibited, and the exhibition as a whole is a fine tribute to the excellence of British professional photography. It remains open until September 28th.

The first general meeting of the newly-formed Shropshire Photographic Society was well attended in Bellstone Hall, Shrewsbury, on Tuesday, September 10th, when the officers and committee were elected. It was decided to proceed with the season's programme of demonstrations, exhibitions, competitions, etc., for both advanced worker and beginner alike. A dark-room complete with enlarging apparatus, optical lantern and screen is being provided for the use of members. Particulars of membership should be addressed to the Hon. Secretary, Mr. H. J. Gornall, 5, High Street, Shrewsbury.

A very attractive programme has been arranged by the Ilford Photographic Society for the forthcoming winter session, which commences on October 2nd. It includes demonstrations of the latest photographic methods and apparatus, not the least interesting of which are "Photography by Sashalite"; a demonstration of Fesagol products by Mr. L. A. Leigh; Etchadine (the

new retouching medium) and Charcoal Black, the beautiful new paper—both demonstrations by Mr. G. H. Potts; the RCA 16-mm. Photophone Sound Camera and Projector; Architecture, by Mr. P. Pelham Crowe; and a practical demonstration of portraiture by Miss Dora Head. New members—beginners or advanced—will be welcomed to the ranks of the society, and all interested should communicate with the Hon. Secretary, Mr. L. S. Shaw, 39, Eastern Road, Romford, Essex, who will be pleased to send particulars of membership.

An exhibition of pictures taken with the Leica camera is now open at the Gallery of Mr. R. G. Lewis, 202, High Holborn, London, W.C.1, and will remain open until October 12th, between the hours of 10 a.m. and 6 p.m. Admission is free to all readers of *The Amateur Photographer*.

The Royal Photographic Society's Annual, "The Year's Photography," has again been issued and is an admirable review of the current R.P.S. show. It contains over fifty pages of reproductions of exhibits in all sections of the exhibition and these are well printed in photogravure. The articles include reviews of the sections. Robert Chalmers describes the pictorial photography, J. Dudley Johnston the lantern slides, Ralph Chislett the natural history work, and E. P. Davey the scientific exhibits. The price of the book is 2s. 6d., paper covers (post free 3s.), or cloth bound 5s. (post free 5s. 9d.). It is obtainable from the Hon. Secretary of the R.P.S., 35, Russell Square, W.C.1.

We regret to announce the death of Lieut.-Col. William Constable Shepherd, which occurred suddenly on Sunday, 15th September, at the age of sixty. Lieut.-Col. Shepherd entered the employ of Ilford Ltd. immediately after leaving school and had been in the service of this company for approximately forty-five years. He was one of the pioneers of the Ilford Photographic Industry, and for upwards of thirty years he was Factory Manager at the Ilford Factory and subsequently was promoted to be deputy chairman of the Production Committee. For his services during the War he was awarded the O.B.E., and this decoration was presented to him by H.M. The King in 1918. His loss to the photographic industry is very great and he will be particularly missed by his colleagues at Ilford, by whom he was held in the highest esteem.

Classes in Photography have again started at the Battersea Polytechnic with Mr. Edgar Senior as instructor. A very comprehensive syllabus has been issued, and the fees per session are very reasonable. Full particulars from the Head of the Chemical Department, Battersea Polytechnic, Battersea Park Road, S.W.11.

A new publication for free distribution to amateur photographers has just been issued by Ensign, Ltd. It is called "The Whole of the Hobby of Winter Photography," and consists of four booklets entitled, "Winter Nights with a Camera," "Picture-making by Enlarging," "Optiscopes and Modern Slide Projection," and "How Shall I Show My Pictures?" The booklets are well produced and illustrated and are sent out in an attractive wrapper. Readers can obtain them from photographic dealers or direct from Ensign, Ltd., 88 and 89, High Holborn, W.C., free on request.

## Exhibitions and Competitions

CURRENT AND FUTURE.

Notices of forthcoming exhibitions and competitions will be included here every week if particulars are sent by the responsible organisers.

*The Amateur Photographer* Monthly Competitions for Beginners, Intermediate and Advanced Workers. Entries, September 30. Rules in this issue.

California Pacific International Exhibition, San Diego.—May 29–November 11. Miss Ruth Kilbourne, Secretary, Exhibition Headquarters, Balboa Park, San Diego, Cal., U.S.A.

Paris International Salon.—October 5–20. Secretary, M. E. Cousin, 51, Rue de Clichy, Paris.

Amsterdam International Salon.—September 14–29. Further particulars from Focus, Ltd. Fotosalon, Bloemendaal, Holland.

London Salon of Photography.—Open, September 14–October 12. Further particulars from Secretary, London Salon, 53, Pall Mall East, S.W.1.

R.P.S. Annual Exhibition.—Open, September 14–October 12. Further particulars from Secretary, 35, Russell Square, W.C.1.

Irish Salon (to be held at Mansion House, Dublin).—Open, November 2–9. Particulars from Hon. Secretary, Irish Salon of Photography, 18, Morehampton Road, Dublin.

Rotherham P.S. International Exhibition.—Entry forms due, September 23; prints, September 30; open, October 16–19. Hon. Exhibition Secretary, E. George Alderman, Ruardean, Newton Street, Rotherham, Yorks.

Indian International Salon (promoted by Camera Pictorialists of Bombay).—Open, November 17–30.

Hon. Salon Secretary, F. R. Ratnagar, Central Bank Building, Fort, Bombay, India.

G.W. Rly. "Camp Coach" Holiday Competition.—Prize, one week's holiday in camp coach during 1936 holiday season. Photographs should depict any aspect of camp coach holiday. Entries due, October 31. Further particulars from Superintendent of the Line, G.W.R., Paddington Station, W.2.

Canadian International Salon, National Gallery of Canada, Ottawa.—November 6–21, and afterwards in other Canadian cities. Entries due, September 20. Entry forms and further particulars from Exhibition Secretary, Canadian International Salon, National Gallery of Canada, Ottawa, Canada.

Seventh Western International Photographic Salon.—November 23–30. Entries close, Monday, October 28. Particulars and entry forms from the Organising Secretary, W. H. Hill-Muchamore, 24, Church Road, Redfield, Bristol, 5.

Cape of Good Hope International Salon (under the auspices of Cape Town P.S.).—Entries due, November 19; open, January, 1936. Hon. Salon Secretary, Richard Dekenab, P.O. Box 2431, Cape Town, South Africa.

IXe International Kertsalon Fotografische Kring "Iris".—Open, December 22–January 5, 1936. Entries close, November 15. Particulars and entry forms from J. Van Dyck, Secretary, "Iris," 69, Ballaerstraat, Antwerp.

Third (Second International) Wilmington Salon of Photography.—Open, January 6–26, 1936. Last day for entries, December 15th, 1935. Particulars and entry forms from the Salon Committee, Delaware Camera Club, P.O. Box 818, Wilmington, Delaware, U.S.A.

Leicester P.S. International Exhibition.—Entries, January 24, 1936; open, February 24–March 7, 1936. Exhibition Secretary, H. Foscutt, 19, Doncaster Road, Leicester.

The 40th Annual Exhibition of the South London P.S.—Open, February 15–March 14, 1936. Entries close, January 21. Further details and entry forms from Hon. Exhibition Secretary, H. S. Adams, 40, Stockwell Park Road, London, S.W.9.

Scottish National Salon.—February 8–29, 1936. Entries close, January 11. Particulars and entry forms from the Hon. Salon Secretary, Norman G. Brown, 36, North Lindsay Street, Dundee.

Vile Salon International D'Art Photographique de Bruxelles, 1936.—Open from March 21–April 5, 1936. Entries close, February 25. Particulars and entry forms from M. M. Devaivre, 152, Rue Markelbach, at Brussels 3, Belgium.

Darwen Exhibition of Photography.—April 20–May 2, 1936. Entries close, March 19. Particulars and entry forms from the Secretary, J. H. Woods, South Down, Belton Road, Darwen.

# TALKIES!

To be up-to-date you must have Talkies. Get one on approval and try it on your friends unexpectedly. They'll be amazed. Your own silent films can be used with sound, too, by a microphone or turntable attached.

All the very latest films are now obtainable, and you can give a professional modern show. Exchange your silent machine now, you will be delighted on test, and friends will be amazed.

We are agents for all makes of Sound Projectors, and will give you best advice in your choice. We can supply a fine model for home use at £75 and £85. We are hoping to run a library scheme of modern sound films at 2s. 9d. per reel only. Write now. You will have the latest films, and we will give you a price on your silent machine in exchange if you will state details.

We can arrange hire terms. Any machine on 7 days' approval.

WRITE TO-DAY.

(We guarantee you will be pleased to change to Sound on test).

## ENSIGN AUTO-RANGE

COUPLED RANGE-FINDER.  
RISE AND CROSS FRONT.

DIRECT FINDER.  
RADIAL FOCUS.

3½×2½ Ensign New Range-finder Roll Film, coupled range-finder, dead accurate focussing, unique rise and cross front (for buildings, unique portraits, etc.), hinged back, quick-loading, radial focus by quick lever, all inlaid, real leather covered. The perfect range camera.

Ensign New f/4.5, in 1 to 1/100th new shutter.....	£7 10 0
Ensign New f/4.5, in D.A. Compur.....	£9 15 0
Zeiss Tessar f/4.5, D.A. Compur.....	£12 15 0
Ross Xpres f/4.5, D.A. Compur.....	£13 12 6

EXCHANGES.      APPROVAL.      HIRE PURCHASE.

Every latest New Camera (any make) supplied by ourselves is sent with our Free 6 Months' Personal Guarantee. By filling in the printed guarantee form supplied with every new camera you are automatically covered against any possible defect or any fault whatsoever.

## The 'LARGE MINIATURE' CAMERA ● OF THE FUTURE ● SUPER IKONTA 530/16

### Outstanding Features:

- 1—Takes large miniature 2½×2½ pictures on 3½×2½ roll film.
- 2—Latest fine-focus rotating wedge coupled and built-in distance meter.
- 3—Special Compur shutter, 1 to 1/400th sec.
- 4—Coupled film winding, making double exposures impossible.
- 5—Instantaneous erecting and unique quick-action fittings.
- 6—Shutter release on top of camera with range-finder and direct optical viewer in close alignment.
- 7—All die-cast body built to fine precision standard.

● The "large miniature" camera of the future. ●  
Zeiss Tessar f/3.5 Speed, Compur, 1 to 1/400th..... £25 5 0  
Zeiss Tessar f/2.8 Speed, Compur, 1 to 1/400th..... £28 5 0

## "EGOFIX" S.S. DOLLY

16 on 3½×2½; 12 on 3¼×2¼;  
● or V.P. Plates. ●

Takes 16 pictures on 3½×2½, 12 pictures on 3¼×2¼, or V.P. plates, all interchanging, three cameras in one, automatic erecting, hinged back, inlaid leather compact metal body, with nickelled edges of the finest workmanship and finish, reverse spooling, so that the film can be rewound and a plate exposed at any time, clip-on quick-action slides, direct optical finder, complete with 3 slides, hooded screen, instructions, carton.

F/3.5 Anastigmat, 3-speed, D. action.....	£7 0 0
F/3.5 Anastigmat, Compur, D. action.....	£9 9 0
F/2.9 Meyer, Compur, D. action.....	£10 10 0
F/3.8 Zeiss Tessar, Compur, D. action.....	£13 13 0

## NEW ZEISS IKON PRECISION ●TWIN-LENS REFLEX IKOFLEX●

The Ikoflex is a beautifully-made twin-lens reflex which gives brilliantly crisp pictures of the highest precision quality. A new departure is a special Zeiss condensing lens underneath the ground glass giving brilliant viewing and illumination right to the very corners of the picture.

The camera is built from a die-cast body that will last a lifetime and will not damage or dent if accidentally dropped. The price is a most compelling low one, and all unique twin-focus reflex features.

Specification.—Die-cast body, helical focussing, self-erecting hood, black leather inlaid covered, automatic film winding, compensation for parallax, depth-of-focus scale, large finder lens, magnifier in hood, and fitted with various lenses below.

Zeiss Novar f/6.3, in Ikoflex shutter.....	£6 10 0
Zeiss Novar f/4.5, in Ikoflex shutter.....	£7 10 0
Zeiss Novar f/4.5, in New Compur.....	£10 2 6

## Cinematography with Autumn Lighting

By S. E. L. MOIR.

SHOOTING in the open air has now been divested of a great element of uncertainty by the introduction of the inexpensive electric photometer. Exposures which formerly were somewhat difficult to calculate can now be read off with extreme accuracy; nor is there much doubt that interior activities will continue to be put off whilst working out of doors can be made to yield satisfying results without the use of expensive illuminants.

This does not mean, however, that autumn shooting is going to prove simplicity in itself, for it is well known that the "natural" filtering which occurs at this time of the year is prone to result in unusual renderings. These can generally be corrected by the considered use of filters; but there are other difficulties not so easily appreciated, and these are usually of greater importance.

### Angle of Lighting.

Successful camera-men frequently exploit the "Rembrandt" lighting, or that arrangement whereby the sun is located at an angle of 45 degrees with the face of the set. Modelling and some detail on the shadow side are achieved with the aid of matt reflectors situated on the opposite side of the set.

At the present season, however, the low position of the sun makes for a greater diffusion of light—and here the effect of using reflectors is rather to lessen the range of tones. Indeed, assuming the use of a small set, it is not too much to say that only a pair or so of efficient reflectors could destroy the deep shadows entirely or to such an extent that the scene would appear flat and lifeless.

To overcome this, it is recommended to use only *small* reflectors—mainly to emphasise major action proceeding on the set. Thus, if it were intended to show a war-maimed wretch begging on the streets (sentimental theme in an anti-war film), the small reflectors would be used as close up as possible to make a high-light of his matches or his mouth-organ or whatever device he may employ to render his calling legal. Similarly, emphasis in the milking sequence shots from Independent Films' "Farm Documentary" is always on the "hygiene" devices.

In larger sets, a great variety of tones from high-lights to deep umbra can be secured by using a *large* reflector, *contre-jour*, some distance behind the

set. The effect here is not that of familiar back-lighting but is to counteract in the upper part of the picture a tendency of the low sun to cause drabness of image.

### Focus.

It will now be appreciated, of course, that the need for "neutral density" filters will become smaller and smaller—nor will it much longer be possible to stop down to the smaller apertures in the lens diaphragm. Now, a small aperture means a deep field of focus, and in a deep field of focus minor errors affecting the making of distance adjustments are not likely to show up. But a large aperture—the use of which is imperative with the reduced intensity of daylight—means a greatly restricted field and a consequent need for the exercise of care in setting the distance flange.

### Filters.

Many amateurs seldom progress beyond the use of filters for cutting down the blue-intensity of daylight (deep yellow being the screening tint most favoured by members of the "dark sky" school). Personally, I have never seen a black sky image that could prevail

after its novelty had worn off; and there will be many black sky images this year if workers persist in the use of these blue-intensity screens. The need at this time is for a screen that will cut out some of the warmer colours in addition to the blue, and for this purpose the use of a deep green filter of the Ilford "Gamma" is strongly to be advocated. An excellent alternative practice is to use super-panchromatic film and no screen whatever.

Inexpert workers possessing orange or amber screens should certainly avoid using them until next summer—for, apart from the question of rendering, some of these filters have multiplying factors and other qualities that make their effective use quite an art in itself.

Finally, filter work at this time of the year calls for the use of an efficient lens hood employed *over* the filter. All the Dallmeyer and certain other ranges are threaded to permit of this arrangement, whilst in difficult cases a suitable hood may be improvised from insulating black tape—a small piece of which may be carried folded in the camera case or in the pocket wallet.

The effective use of filters plays a great part in amateur cinematography. In the accompanying still from "Farm Documentary," the effect is to preserve an atmosphere of peace following the harvest activities.

# A Film any Amateur might have Made

By ROBIN STRAWN.

**D**OCUMENTARY is, without doubt, the finest amateur film form; because in documentary only can the amateur product compare with the professional.

Yet the preconceived notion that documentary cannot be entertainment at the same time remains the greatest deterrent to documentary film production in both amateur and professional fields.

There is now showing a film at the local cinemas. It is made by a professional, shall we say, on holiday. It is an experiment in novel film production. It is a documentary, yet at the same time fine entertainment. It is a film any amateur might have made, but which, by virtue of its professional manufacture, finds standard commercial release.

"Wharves and Strays" has been made by Bernard Brown, who is employed by London Film Productions. It is a documentary of dockland, seen, not through the eyes of a camera investigator, but through the eyes of Bernard Brown's own little dog, "Scruffy."

It was taken with an ordinary silent film camera. The sound you hear in the cinemas has been added after production.

Nothing, or nearly nothing, has been staged. The dog has been allowed to wander and behave at will. But clever editing on the bench has brought us a really human story of a waterside doggie's day.

The film opens with a picture of the docks in the early morning; a close-up of a dog getting up from behind some boxes; a shot of gates opening, feet walking quickly, a number of men

walking along a street, photographed from the back.

Gradually the dock comes to life, and we are back with the dog, who sees a cat and gives chase.

He upsets boxes and other things, and eventually gets on to a crane, on which he is carried, and we get his viewpoint as he swings over the ground.

He escapes safely, and meets workmen who are going to have something to eat, but they go into a restaurant and close the door, leaving "Scruffy" outside, facing a notice "No Dogs Admitted."

He goes round to a butcher's, and is chased away.

You should notice carefully how sparing are the shots, and how effective is a close-up of the butcher frantically waving his arms, immediately followed by the dog running away as hard as he can go.

Next he meets a street musician. He listens for a bit, then realises that he dislikes the sound and barks.

The post-recorded sound plays an effective part in the film. Running smoothly all the way through, it provides continuity where visual image is lacking in it. But this does not mean sound is essential. You will have to be more careful to get all the shots you want and more patient in the editing, that is all.

And there is always a way out of the difficulty of sound itself. For instance, in the silent film of Sternberg's "The Docks of New York," he wished to create the effect of the sound of a pistol shot, so immediately after the actual picture of the shot, we get a picture of the sudden scared rising of a flock of birds.

However, back to "Wharves and Strays." "Scruffy" eventually comes to

a pub, outside of which are some men drinking beer. One of them gives him some to drink in a saucer. This makes him tipsy.

We get a slow-motion picture of the dog running, some very quick cutting, and then mixing from one scene to another.

Here again, if mixing is difficult for the amateur, other methods can be adopted, such as turning the camera over in a complete somersault.

Our dog hero is in such a state that he walks right into the river, which, of course, immediately sobers him up. He is picked up by a tug in mid-river.

We see his tour of exploration of the tug; how he is enthralled by the engines, the fun he has with the ropes, one of which he pulls, manipulating the funnel of the tug.

The tug comes to a wharf, and he wanders off looking for a resting-place for the night. He meets a tramp, makes friends with him, and the two of them settle down.

So simple, and yet such a clever film. It is documentary, yet dramatically powerful. It shows us life in the dock, and work aboard a river tug, while ostensibly giving us the adventures of a dog.

And being shot from a doggie viewpoint it loses nothing in documentary value, yet gains much in interest. Amateurs should learn much by seeing it. By watching it carefully, and ignoring the sound which tries to deceive you, you can see how the whole film is made.

Being a short film, it is not likely to be extensively advertised, so ask your local cinema manager if he is showing it, and when. Otherwise you could ask him to book it especially to show to your local ciné society.

*Features  
that give cine amateurs advantages  
unobtainable with any other 16mm. camera*

## MOVIKON

The Movikon brings 16-mm. cine apparatus right up to date, and gives the amateur at least as many facilities—in some respects more—than are obtainable with professional standard size cameras.

- The following are exclusive Movikon features :
- Distance meter automatically coupled with lens focussing—guess-work is not good enough for the estimation of distances when using modern large-aperture anastigmats. ● Automatic compensation for parallax. As you focus your lens so the image in the finder is adjusted to embrace the exact view. ● Shutter adjustment for varying exposures from 1/25th to 1/1,250th sec. ● Take-yourself automatic delayed-action release. ● Zeiss Sonnar f/1.4 is fitted as standard, in an interchangeable mount so that other lenses can be used.

Of course the Movikon takes any make of film in 50-ft. or 100-ft. spools ; is provided with an angle view-finder for round-the-corner work ; has a clock-work motor giving an even speed throughout the whole length of drive, gives single pictures when required, and adjustable film speeds from 12 to 64 frames per second.

The whole story of the Movikon is told in our Movikon brochure, which will be sent free on application.

ZEISS IKON, LTD., 11, MORTIMER HOUSE, MORTIMER ST., LONDON, W.1

## LET US SHOW YOU

THE NEW  
*Leica*  
Model IIIa

Get into touch with us about the LEICA. Learn all about the special advantages we can offer—in EXCHANGES and OUT-OF-INCOME TERMS.

At each of our four branches LEICAS have always been a leading feature, and our specialised knowledge is always at your disposal—whether you call or write.

### LEICA ACCESSORIES.

The precision and simplicity of the LEICA in "taking" the picture is extended to many specialised photographic requirements by the remarkable range of LEICA attachments and accessories. Let us tell you about them.

"Correx" Developing Tank, specially recommended for Leica films.

LEICA Model IIIa, automatic coupled range-finder focussing, focal-plane shutter speeded to 1/1,000th, Summar f/2 lens, chromium finish, £43 0 0, or nine monthly payments of £5 0 4. (Other Models from £16 19 0.)

## 'LARGODREM'

Electric Exposure Meter  
for Bromide Enlarging.

A new Electric Exposure Meter which indicates absolutely correct exposure when making bromide enlargements from any negative.

The "Largodrem" is something quite new to photography ; a meter that has long been needed and one of immense value to both amateur and professional photographers.

The "Largodrem" is connected to the same electric circuit as that from which the enlarger is run. A duplex adapter serves most conveniently for this purpose.

Price .. 30/-

When ordering please state the voltage of the electric lamp of the enlarger.

2-way Adapter .. 3s. 6d. extra.

## "LARGODREM TESTER"

Bromide papers are usually supplied by the makers without any indication of their speed. Papers of the same kind and make are not always the same. By means of the "Largodrem Tester," used in conjunction with the "Largodrem," the rating of any bromide paper when using the "Largodrem" can be quickly ascertained.

Price 3/6

# Make your own enlargements

Zeiss Ikon, always foremost with precision instruments, offer a varied selection of high-class enlargers. First

## The MIRAPHOT

A vertical automatic focusing enlarger in three sizes: (a) for negatives any size up to  $9 \times 12$  cm. ( $4\frac{1}{2} \times 3\frac{1}{2}$ ); (b) up to  $3\frac{1}{2} \times 2\frac{1}{2}$ , and (c) up to  $1\frac{1}{8} \times 1\frac{1}{4}$  ( $3 \times 4$  cm.). With the MIRAPHOT manipulation is simple. The lenses give perfect definition, thanks to the scientifically designed reflector, illumination is even and negatives seldom require retouching.

Prices, complete with Zeiss Tessar f/4.5.

For negatives up to  $9 \times 12$  cm. £14 15 0

For negatives up to  $3\frac{1}{2} \times 2\frac{1}{2}$  £10 15 0

With Zeiss Ikon anastigmat. For negatives up to  $1\frac{1}{8} \times 1\frac{1}{4}$ , £11 2 6

## The MIRAX

is an all-metal enlarging attachment which utilises your roll-film or plate camera from  $3\frac{1}{2} \times 2\frac{1}{2}$  to  $4\frac{1}{2} \times 3\frac{1}{2}$ . It can be used horizontally, as illustrated, or vertically with the MIRAX vertical easel. It gives powerful illumination, consequently short exposures, and it is the most economical way of obtaining a first-class enlarger.

Prices for camera up to  $4\frac{1}{2} \times 3\frac{1}{2}$ , including lamp.....£3 7 6  
Prices for camera up to  $3\frac{1}{2} \times 2\frac{1}{2}$ , including lamp.....£3 10 0

The Mirax is normally supplied for horizontal use as illustrated, when equipped with easel for vertical use costs £1 17 6 extra. ZEISS IKON products are stocked by most good camera shops, name and address of nearest dealer on request.

## Add this Advantage

—that Criterion MEZZOTONE Lantern Plates have a grain so minute as to permit the making of lantern slides by enlarging from miniature camera negatives... Advantages more generally known are the combination of warm tones by direct development with a speed that renders reduction and contact work equally simple... and a price margin that brings to you a dozen plates for 1/10.

## In the Paper

Warm tone, speed approximates that of bromide paper, long scale gradation, exceptional latitude, a range of 9 unparalleled surfaces, including the new LUSTRA — a crushed rough grain which yields great brilliancy, combined with softness.

# Letters to the Editor

*The Editor is not responsible for the opinions of his correspondents.*

## "THE SHADOW ON THE SAND."

SIR,—I agree entirely with Mr. C. J. Williamson in his remarks on this picture. Immediately I saw it the shadow struck me as being quite artificial, and I made a much more satisfactory composition by trimming it completely away.

The absence of any shadow under the right arm, which Mr. Williamson points out, leads one to suppose that the exposure was made in flat lighting and the foreground shadow added afterwards.—Yours, etc., W. McWILLIAM.

SIR,—As I think "The Shadow on the Sand" is one of the most pleasing pictures that you have reproduced since I started reading your magazine, I have been especially interested in your correspondents' criticisms of the character of the shadow.

I am of the same opinion as "Tyro," and would like to "reinforce" his statements.

It will be seen that the sun's rays are parallel to the plane of the picture, and as the sun is infinitely far off in comparison to the small distances enclosed by the picture, the rays themselves can be assumed parallel to one another (ask a mathematician!).

In these circumstances, if lines are ruled from outstanding points on the figure to the corresponding shadow points, the lines so drawn should be parallel.

I have found this to be the case and am convinced that nothing but a perfectly natural shadow could satisfy this condition. Any apparent distortion in shape is due to the uneven surface of the sand.

With regard to the depth of tone of the shadow, it does not to me seem unnatural. As "Tyro" pointed out, the sand is the most important reflecting surface, since the rocks seem to be for the most part in shadow. Reflection from the sand will, of course, be upwards, and only a double reflection back from the rocks can tend to lighten the tone of the figure's shadow. The latter will thus be of deeper tone than the rock shadows.

I can only say in finishing that I wish I could produce such a picture as "The Shadow on the Sand."—Yours, etc., A. PROCTER.

## EXPOSURE METERS.

SIR,—In answer to "A. H." under the heading "Exposure Meters," in a recent "A.P.," may I explain myself?

In my first calculation the exposure was  $1/200$ th with a  $\times 3$  filter, and as I desired to find the equivalent exposure *without* the filter I *divided* by 3.

In the second, the exposure was  $1/40$ th *without* the  $\times 3$  filter, and as I wanted the equivalent exposure *with* the filter I *multiplied* by 3.

Quoting from "A. H.'s" letter, he says, "An exposure of  $1/100$ th with an  $\times 3$  filter would be  $3/100$ ths, or  $1/33$ rd." Notice the  $1/100$ th *with* an  $\times 3$  filter. If "A. H." had said " $1/100$ th" and the filter then put on it would be  $1/33$ rd, but the filter is already on, and the exposure is  $1/100$ th with filter.

Thus, if the equivalent exposure *without* the filter was required you would divide by 3, as I did in my first calculation.

I may be wrong, and if so, no doubt a sharper reader of "The A.P." will point this out to me.—Yours, etc., S. L. CARTER.

## CAMERA MOVEMENT DURING EXPOSURE.

SIR,—Your correspondence on this subject has been quite extensive, but I suggest that the root of the matter has been overlooked. The relative effects of a given camera movement with different cameras is only one side of the question; the likelihood of movement must also be compared in the two cases.

Consider two cameras, 1 and 2, geometrically similar, but imagine 1 to be, in every dimension, half the size of 2. For purposes of comparison the negative from 1 must, of course be enlarged two diameters, while a contact print is to be made from 2. The two prints will now be identical if taken from the same viewpoint and in the same direction. If, now, the two cameras during exposure are displaced bodily by the same

amount, the two prints will show the effect of movement to the same extent, which will be zero in the infinity plane and will increase for planes nearer the camera. Again, if the cameras are rotated through the same angle about parallel axes through corresponding points (say the optical centres of the respective lenses), the resulting prints will once more show the effect of movement to the same extent, but in all planes equally.

But when the cameras are held in the hand, what is the probability that 1 will be displaced by the same amount as 2? If the two are geometrically similar and of the same materials, then the inertia (tending to resist a sudden bodily displacement) will be eight times larger in the case of 2 than in the case of 1. Also the resistance to a sudden angular rotation caused by a given force (acting at corresponding points in the two cameras) will be sixteen times larger in the case of 2. Consequently, the larger camera will require much larger forces to produce the same vibration or shake.

If, now, we consider, as Mr. Dickinson did in his article, the relation between the relative apertures, it is reasonable to take for a basis of comparison the apertures which will give a circle of confusion of the same diameter upon prints of the same size. This requires the  $f/$  numbers to be in the ratio of 1 to 2, and hence the exposures must be in the ratio of 1 to 4. The factors 8 and 16 in the previous paragraph will thus be reduced to 2 and 4 respectively. Of course, the similarity between two actual cameras cannot be complete, and these factors will be on the high side on this account. On the other hand, however, in everyday practice, the  $f/$  number of camera 1 would probably be greater than half that of camera 2, which would tend to readjust the balance. We may conclude, then, that the effect of camera shake is several times greater with camera 1 than with camera 2.

One further point: the large camera is usually held close to the body, and the view-finder is generally of the brilliant or reflex type. The miniature camera, however, is designed for use at eye-level, and in this position steadiness is much more difficult to achieve. Even if the hands are steadied against the forehead, a pulse in thumb or temple can produce vibrations which would be much smaller with a heavier camera. Personally, I believe that this is the crux of the matter.—Yours, etc., H. G. YATES.

## NIGHT PHOTOGRAPHY.

SIR,—May I crave a portion of your valuable space in which to pass on a hint to beginners in night photography?

Of late I have been shown a great many floodlight photographs, a number of which were marred by bad lens-flare.

An expensive camera with a good lens seems to be more susceptible than a cheaper type of camera. Whether or not this is a recognised fact I do not know.

I have found from personal experience that the use of a lens hood entirely obviates this annoying difficulty.

Hoping this hint will be of use to beginners in night photography.—Yours, etc., HV/KTSL.

## TROUBLE WITH ROLL-HOLDER.

SIR,—S. G. J.'s trouble with a roll-holder, described in his letter printed in the issue of September 4th, is surely due to the fact that the film is not held flat in the focal plane. That would account for part of the film being in and part out of focus. Similarly, the phenomenon of near objects being focussed correctly and the more distant incorrectly is explained by the greater degree of accuracy required in focussing distant objects. For instance, on my own camera, the scale marks for 15 and 25 ft. are only  $1/16$ th in. apart, while those for 3 and 5 ft. are  $\frac{3}{8}$  in. apart, a focussing ratio which would mean that an error of only  $1/32$ nd in. in the position of the film would mean an error in focussing of 5 ft. on a distant object, and of only 2 in. on a nearer object.—Yours, etc., STEPHEN PRITT.

# The Amateur Photographer & Cinematographer

## ANNUAL Lantern-Slide Competition 1935

EVERY reader of *The Amateur Photographer* who is interested in the making of lantern slides should participate in "The A.P." Annual Lantern-Slide Competition. Not only are the seven classes comprehensive in their variety of subjects to suit all workers, but inclusion of slides in "The A.P." prize set which circulates throughout the British Isles can be considered as the hall-mark of excellence, which every lantern-slide maker should strive for. Each succeeding year the competition proves increasingly popular, and has come to be regarded as a test of merit in lantern-slide production. We hope, therefore, that again this year every lantern-slide maker will enter the competition. The conditions and awards are set out below. It should be noted that

the awards are made to individual slides and not to sets; but every competitor can send as many slides into as many classes as he or she desires. The slides are judged on the screen under the best conditions. After the judging the prize-winning slides, and a number of others which are selected for purchase, form the exhibition collection which goes on tour to all parts of the country for a year or more. Secretaries of photographic societies who have not yet booked the set of "A.P." Prize Slides should hasten to do so, and submit alternative dates. This is necessary to enable a complete and expeditious itinerary to be arranged before the slides start on their journey in November. In the meantime, those who intend entering this competition should note that the closing date for receiving entries is Thursday, October 31st.

### Classes and Subjects.

- |   |   |
|---|---|
| CLASS I.—Landscape with or without figures, sea subjects and river scenery.   | CLASS V.—Natural History subjects.  |
| CLASS II.—Portraiture and figure studies, whether indoor or outdoor pictures. | CLASS VI.—Lantern slides in colour (not hand-coloured).   |
| CLASS III.—Architecture, interior and exterior.                               | CLASS VII.—Champion Class. Open only to those who have won silver or bronze plaques in <i>The Amateur Photographer and Cinematographer</i> lantern-slide competition. |
| CLASS IV.—Flowers, fruit and other "Still-Life" subjects.                     |   |

### Conditions and Awards.

(1) All classes are open to amateur and professional photographers without any restrictions. All slides must measure  $3\frac{1}{4} \times 3\frac{1}{4}$  in., and must be properly spotted for showing in the lantern.

(2) One silver plaque, one bronze plaque, and four certificates are offered in each class except Class VII. In that, the Champion Class, the award will be a mounted and signed exhibition picture by Mr. F. J. Mortimer, the Editor of *The Amateur Photographer and Cinematographer* and *Photograms of the Year*.

(3) All slides which receive any award will become the property of *The Amateur Photographer and Cinematographer*, and will be sent round amongst the societies and such other associations as apply for the loan of them. Any other slides may be selected for circulation in this manner, and will be paid for at the rate of half a crown each.

(4) Competitors may send any number of slides in any class, and may be recorded as winning any number of awards; but no competitor will actually receive in the competition more than one silver plaque, one bronze plaque, and one certificate, on which all his awards will be recorded. Competitors may enter in any number of classes.

(5) Each slide must bear the competitor's name, its title and its class. With the slides must be sent an envelope containing the name and full address of the competitor, a list of

the titles of all the slides he is sending in, and the class in which such are entered. Particulars as to make of plate, exposure, developer used, etc., and other technical data which may be of interest for incorporation in the notes which will accompany the winning slides on their tour among the photographic societies, should also be given where thought necessary.

(6) A stamped and addressed label (not loose stamps) should be sent with the slides for their return if unsuccessful; but in no circumstances can the Editor or the Publishers accept any responsibility for slides sent in for competition, nor for their return; neither can slides be returned which are not accompanied by stamps as above.

(7) Not more than one slide from any one negative can be admitted, nor may any slide compete which has before won an award in these competitions.

(8) The last day for receiving is Thursday, October 31st. The slides must be well packed and addressed, "Slide Competition, The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and all carriage charges must be prepaid.

(9) In any case of dispute, the competitor agrees to accept the decision of the Editor of *The Amateur Photographer and Cinematographer* as final.

# "The A.P." Monthly Competitions

AWARDS FOR  
AUGUST.

THE exhibition season is already reflected in the entries for the competitions for August. A great number of the prints appear to have been prepared on a smaller scale to those sent to the shows, and we welcome this phase of activity on the part of our readers. The entries were very numerous again in all sections, and the standard higher than usual. The awards are as follows:

## ADVANCED WORKERS' SECTION.

First Prize.—"Bush House," by George A. Slight, 18, Ewelme Road, Forest Hill, London, S.E.23.

Second Prize.—"Boats in the Sun," by Yahya Arif, 8, Rue Ismail Pacha, Garden City, Cairo, Egypt.

Third Prize.—"Quiet Moorings," by Kenneth M. Trathen, Mount Carbis, Redruth, Cornwall.

Mounting Prize.—"The Bather," by J. F. Cutler, 52, Gibbs Green, Edgware, Middlesex.

Certificates of Merit.—"Still Life," by Miss K. M. Caudwell, Westwick, Norwich; "Industry," by J. H. Clark, 304, Cambervell New Road, London, S.E.5; "River Craft," by H. Emmett, 10, Moss Road, Winton, Northwich, Cheshire.

The prints not receiving awards have been grouped, those in the first group receiving Honourable Mention. The others have been marked Class 1, Class 2, and Class 3, respectively.

Those awarded Honourable Mention are as follows: A. V. Bibbings (Newton Abbot); F. Annis Burrows (Chalfont St. Peter, Bucks); (2) J. H. Clark (London, S.E.); (2) T. G. Corkill (Johannesburg); Homi K. Dady Burjor (Bombay); Miss V. M. Ennis (Hampton Wick); E. A. Fordham (West Wickham); James C. Gilchrist (Skelmorlie, Ayrshire); Francis E. Jones (Tyldesley); (2) Wm. Jackson (Hull); Arthur Keen (Calgary, Alberta); E. F. Laevaert (Belgium); (4) Dr. I. Magdi (London, N.W.); (2) A. Pitman (London, W.); A. C. R. Redgrave (Margate); Jack Robinson (Sydney, N.S.W.); Captain G. Tanner (Nairobi); Kenneth N. Trathen (Redruth).

## INTERMEDIATE SECTION.

First Prize.—"Sunshine in the Crypt," by R. Rowland Hill, Heatherdene, Etching Hill, Rugeley, Staffs.

Second Prize.—"Happy Childhood," by J. H. Hunter, 5, Hawthorn Grove, Wallsend-on-Tyne, Northumberland.

## PRIZES AND RULES.

### (I) For Advanced Workers.

This class is open to all amateur photographers. First Prize.—One guinea in cash or "A.P." silver plaque (optional).

Second Prize.—Half a guinea in cash or "A.P." bronze plaque (optional).

Third Prize.—Five shillings in cash.

A special prize of five shillings in cash for the best mounted picture.

### CERTIFICATES OF MERIT.

In addition to the general rules (see below), the following conditions apply:—

(1) All prints must be accompanied by a stamped addressed envelope or wrapper if they are to be returned. Prints receiving an award will be retained.

(2) Prints must be mounted, but not framed.

(3) Returnable prints in the Advanced Section will be sent back with a typed criticism, and classified according to merit.

(4) Prints may be of any size and by any process, and must be the competitor's own work throughout.

(5) The award of a prize or certificate in the Advanced Workers' Competition or any other competition or exhibition will not debar the competitor from entering again on future occasions and winning further prizes.

### (II) For Intermediate Workers.

This class is to encourage those readers who have passed the "beginner" stage and may have won an award in the Beginners' Competition, but have not progressed sufficiently to enter in the Advanced Competition.

First Prize.—Half a guinea in cash.

Second Prize.—Five shillings in cash.

### CERTIFICATES OF MERIT.

In addition to the general rules (see below), the following conditions apply:—

(1) No print must be larger than 10x8 in., and can be by contact or enlargement by any process, and may be mounted.

(2) The whole of the work (exposure, development, printing, etc.) must be carried out by the competitor.

(3) Prints entered in the Intermediate Section will be criticised and returned if accompanied by stamped addressed envelope or wrapper. Prints receiving an award will be retained.

(4) The award of a prize or certificate in the Intermediate Competition debars the competitor from entering this competition again, but he is then eligible for the Advanced Workers' Section.

### (III) For Beginners.

This class is open to those who have never won an award in any photographic competition or exhibition.

First Prize.—Half a guinea in cash.

Second Prize.—Five shillings in cash.

### CERTIFICATES OF MERIT.

In addition to the general rules (see below), the following conditions apply:—

(1) No print must be larger than 6x4 in. Contact prints or small enlargements up to this size are eligible, but must be unmounted.

(2) The exposure must have been made by the competitor, but developing and printing may be the work of others.

(3) No prints can be criticised or returned.

(4) The award of a prize or certificate in the Beginners' Competition debars the competitor from entering this section again.

### General Rules.

(1) Any number of prints may be entered, but each print must have on the back the appropriate coupon

Certificates of Merit.—"Evening in Old Walthamstow," by C. B. Capener, 50, St. John's Road, Walthamstow, London, E.17; "Evening," by G. W. Day, 111, Lutterworth Road, Nuneaton; "Portrait," by K. Muthuramalingam, c/o A. Arunachalam, Advocate, 120, Thaipappa Mudaly Street, G. Town, Madras; "Evening," by Mrs. K. M. Parsons, 83, St. Peter's Avenue, Caversham Heights, Reading.

## BEGINNERS' SECTION.

First Prize.—"If Winter Comes . . .," by Miss Christina H. Parkinson, Bristol Hotel, Colombo, Ceylon.

Second Prize.—"Margerie," by Victor Dugand, Barranquilla, Colombia.

Certificates of Merit.—"Unemployed," by G. H. Brumpton, 10, Northfield Way, Retford, Notts; "Near Clarinda," by I. H. Green, The Hill, Warrigal Road, Oakleigh, Victoria, S.E.13; "Evening, Lake Maggiore," by Miss M. C. Poole, Hemphol, Mayfield, Sussex; "The Cyclist," by L. Reynolds, 50, Westmorland Street, Fimlico, S.W.1; "The Water Lily," by Len Vokes, 25, Mytongate, Hull.

(see advertisement pages) the date of which must be within five weeks of the closing date of the competition. Overseas readers may use the most recent coupons to hand.

(2) Each print must have on the back the name and address of the competitor, and the title.

(3) All entries must be addressed to The Editor, *The Amateur Photographer*, Dorset House, Stamford Street, London, S.E.1, and the package must be marked on the outside "Beginners," "Intermediate," or "Advanced," as the case may be.

(4) No packages will be received on which there are postage charges to be paid.

(5) No communications on other matters should be enclosed with competition prints. No correspondence in connection with the competitions can be undertaken.

(6) The entry of a print will be regarded as a declaration that it is eligible under the rules, and that the competitor agrees thereto.

(7) No responsibility is taken for the safety of prints, and the Editor's decision on all points connected with the competitions is final.

(8) The publishers of *The Amateur Photographer* shall have the right to reproduce, without payment, any print entered, or to allow its reproduction in any other paper quoting from *The Amateur Photographer*.

(9) The closing date of each competition is the last weekday of the month. Prints arriving late will be entered for the next month's competition.

(10) The cash prizes awarded in these competitions are dispatched on the fifteenth of the month following the announcement of the awards.

The closing date for the September competition is Monday, September 30th, and for the October competition, Thursday, October 31st.

# THE WEEK'S MEETINGS

## Wednesday, September 25th.

Borough Polytechnic P.S. Annual General Meeting.  
Northallerton and D.P. and C.S. Y.P.U. Portfolio. Criticisms. R. Robinson.  
Rochdale P.S. Practical Demonstration on Enlarging.

## Thursday, September 26th.

Bury P.S. Development of Plates: Tank versus Visual. J. H. Mould.  
Hammersmith H.H.P.S. "The Châteaux and Churches of Tours." E. W. Harvey Piper.  
N. Middlesex P.S. Portraiture—Studio Evening. H. L. Wallis.  
Northamptonshire N.S.P.S. Reunion. Photographic Topics.

## Friday, September 27th.

Hackney P.S. Members' Sale.  
King's Heath and D.P.S. Slide-Making (illustrated by Slides). B. Moore.  
Manchester Y.M.C.A. P.C. "Good Hunting at the Zoo." R. W. A. Burgess.  
Royal P.S. Exhibition Lantern Slide Night.  
Wimbledon Ciné Club. Programme of Films.

## Saturday, September 28th.

Bath P.S. Orchardleigh and Lullington.  
Dennistoun A.P.A. Week-end Outing.  
Hull P.S. Outing: Barton.  
Luton and D.C.C. Essendon. L. & N.E.R., 1.3.  
N. Middlesex P.S. South Mimms and Ridge.  
Nottingham and Notts P.S. Edwinstowe.  
Sheffield P.S. Ashton and District.  
Singer C.C. Glasgow Harbour.

## Sunday, September 29th.

Borough Polytechnic P.S. Somewhere in Essex.  
Hanley P.S. Bagnall.  
Wimbledon C.C. Caterham.

## Monday, September 30th.

Bexley Heath P.S. "The Fishing Industry." Miss M. Oliver.  
Halifax P.S. Committee Meeting.  
Hammersmith H.H.P.S. Members' Monthly Competition (Prints).

# Readers' Questions ANSWERED

**GENERAL.**—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

**CONTRIBUTIONS.**—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

**ENQUIRIES AND CRITICISM.**—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a *separate* stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

## Green Toner for Bromides.

Can you give me a formula for making a green toner for bromide prints? H. L. (Prestwick.)

Although green tones can be obtained on bromide papers the results are not altogether satisfactory, and we always recommend that, if a green colour is required, the best method is to use the Carbro process, choosing a suitable pigment from those supplied by the Autotype Co., Ltd. (59, New Oxford Street, London, W.C.1). Vanadium is the salt used for obtaining green tones, and if you can refer to the "Dictionary of Photography" you will find that nearly a page is devoted to the method under the general heading of "Toning."

## Stale Gaslight Paper.

Is there any special developer available for very old gaslight papers which go grey and fogged when the usual developers are used?

G. F. (Birmingham.)

If your paper has been stored in a damp place there is no possibility of getting good prints from it now. If the deterioration is merely due to age the paper can sometimes be restored, but, unless you have a large quantity of paper, it is hardly worth doing. The process is rather a troublesome one and the paper is very considerably slowed down in speed.

## Our Competitions and Copyright.

A few years ago I won a prize in your Beginners' Competition. Can I now send another print from the same negative to a newspaper competition, or do you still hold the copyright?

I. F. (Oxford.)

In such a case as you mention we do not claim any right whatever to the copyright in the print, but only permission to publish it possibly amongst the beginners' prints which we reproduce week by week. As your print was entered years ago it certainly will not be used now, and you are quite at liberty to enter it for a competition and to sell the copyright if you choose.

## Reducing Old Negatives.

Can the persulphate reducing method be used satisfactorily with a negative that is several months' old?

F. R. (East Ham.)

There is no reason why the reducer should not work with an old negative, but we should advise you to soak it first in clean water for at least an hour, in order that the emulsion is washed and softened thoroughly.

## Reflex Mirrors.

I have been told that it is useless to use an ordinary glass mirror in my reflex in place of the existing one which has become badly tarnished and dim. Is this so, and what is the objection?

T. C. (St. Albans.)

If ordinary mirror glass is used for this purpose, one sees a double image on the ground glass. This is caused by the surface of the glass as well as the silver backing reflecting the image. As the mirror is held at an angle these two reflections are slightly displaced and this causes confusion. Thus all reflex mirrors are silvered on the surface only and varnished to protect it. If it must be cleaned, a soft camel-hair brush lightly used is all that is needed.

## Reticulation.

What is the cause of the queer markings on the enclosed plate? It is only recently that I have had this trouble, although I take care to filter my solutions and rock during development and fixing.

C. E. F. (Letchworth.)

The defect in your negative is what is known as reticulation. The most common cause of this is transferring the plate from a solution of a certain temperature to another solution with a temperature that is considerably higher or lower. You can probably tell from the details of your procedure whether this is likely to be the cause.

## Preservative for Mountant.

Can you give me the name of another preservative for mounting paste instead of oil of cloves and oil of wintergreen?

N. B. (Lincoln.)

The preservative you require is simply oil of almonds instead of the others you name. About 15 minims of this to 64 ounces of water would be about right.

## Amateur Status.

If an amateur photographer sells his prints to illustrated newspapers and magazines does he, by so doing, become a professional?

P. S. (Norbury.)

In the circumstances you mention an amateur would not be considered a professional unless a very appreciable proportion of his income were derived from the sale of photographs.

## Identifying Exposures.

Is there any method of marking roll films after each exposure, for identification purposes later?

A. B. (Eastbourne.)

We presume that you develop your roll films in the strip, and in that case it would only be necessary for you to give a number to each spool of film and make a note of the successive exposures made on it. You could then number and identify each section before cutting the film up.

## Safety Covers for Panchromatic Films.

As my camera does not possess a safety cover over the red circular window is it unsafe to panchromatic films?

W. F. P. (Melksham.)

We cannot say off-hand whether you will have trouble with fogging or not. With some cameras the light passing through the ruby window is reflected on to the film by parts of the camera near the rollers or elsewhere. In any case, it is safer to have a covering over the window, and with some films a small piece of adhesive plaster is provided for the purpose.

## Desensitising and Grain.

Does a desensitising bath before developing have any effect on the emulsion grain, and is it likely to stain the celluloid base of roll films?

K. W. R. (Stockport.)

Desensitising is quite a common practice, and, if properly carried out, has no adverse effect on the results as regards grain or staining the celluloid base. If you use the familiar pinacryptol green you will get no stain whatever on the negatives.

## Frilling in Development.

I have recently had trouble with frilling and pieces of emulsion becoming detached after developing and fixing, but found that some alum added to the hypo was an excellent remedy. Can you give the correct proportions?

E. R. (Merton Park.)

If you make up a fixing bath with alum it must be done in a proper manner. The following formula is a good one. In 20 oz. of water dissolve 8 oz. of hypo and 120 grs. of potassium metabisulphite. In another 20 oz. of water dissolve 240 grs. of chrome alum. Add the second solution to the first. This is suitable for both negatives and prints, but for the latter purpose might be diluted, say two parts of stock solution to one part of water.

# The AMATEUR'S EMPORIUM

## Business Notices

### Publishing

**OFFICES.**—Dorset House, Stamford Street, London, S.E.1. Telegrams: "Amaphot, Sedist, London." Telephone: Hop 3333 (50 lines).  
**PUBLISHING DATE.**—"The Amateur Photographer and Cinematographer" is on sale throughout the United Kingdom every Wednesday morning.  
**SUBSCRIPTION RATES.**—British Isles 17/4 per annum, Canada 17/4, other countries abroad 19/3 per annum, post free.  
**REMITTANCES.**—Cheques, etc., should be crossed and made payable to Iliffe and Sons Ltd. "The Amateur Photographer" can be obtained abroad from the following: **UNITED STATES:** The International News Co., New York. **FRANCE:** W. H. Smith & Son, 248, Rue Rivoli, Paris; Hachette et Cie, Rue Reaumur, Paris. **BELGIUM:** W. H. Smith & Son, 71-75, Boulevard Adolphe Max, Brussels. **AUSTRALIA:** Gordon & Gotch, Ltd., Melbourne (Victoria), Sydney (N.S.W.), Brisbane (Queensland), Adelaide (S.A.), Perth (W.A.), and Launceston (Tasmania). **NEW ZEALAND:** Gordon & Gotch, Ltd., Wellington, Auckland, Christchurch and Dunedin. **INDIA:** A. H. Wheeler & Co., Bombay, Allahabad and Calcutta. **CANADA:** Imperial News Co., Toronto, Winnipeg and Vancouver; Benjamin News Co., Montreal; Gordon & Gotch, Ltd., Toronto. **SOUTH AFRICA:** Central News Agency, Ltd.

### Displayed Advertisements

Communications on Advertisement matters should be addressed: The Advertisement Manager, "The Amateur Photographer and Cinematographer," Dorset House, Stamford Street, London, S.E.1. Copy for displayed advertisements for the issue of any particular week must reach Dorset House by the first post on Tuesday morning in the week previous. Rates and conditions will be sent upon application.

### Prepaid Advertisements

**SALE AND EXCHANGE: AMATEURS ONLY**—  
 12 words or less ..... 1/-  
 1d. for every additional word.  
**PROFESSIONAL AND TRADE:**—  
 12 words or less ..... 2/6  
 2d. for every additional word.  
 Each paragraph is charged separately.  
**SERIES DISCOUNTS** are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid and posted to arrive at the Head Office, Dorset House, Stamford Street, S.E.1, not later than first post FRIDAY for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 260, Deansgate, Manchester, 3; 26n, Renfield Street, Glasgow, C.2.

Advertisements are inserted, as far as possible, in the order received, and those received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

Postal Orders sent in payment for Advertisements should be made payable to ILIFFE AND SONS LTD., and crossed

& Co.

Notes being untraceable if lost in transit, should not be sent as remittances.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

**BOX NUMBERS.**—For the convenience of advertisers, letters may be addressed to numbers at the office of this paper. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charges, which must include the words: "Box 000, c/o 'The Amateur Photographer'." Replies should be addressed: "Box 000, c/o 'The Amateur Photographer,' Dorset House, Stamford Street, London, S.E.1." and these letters will be simply forwarded by us to the advertiser. It must be understood that we do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisement. Readers who reply to Box No. advertisements are warned against sending remittances through the post except in registered envelopes. In all such cases the use of the "Deposit System" is recommended.

### Special Note

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post. When sending remittances direct to an advertiser, stamp for return should also be included for use in the event of the application proving unsuccessful.

### Deposit System

Readers who hesitate to send money to advertisers in these columns may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Amateur Photographer and Cinematographer," both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods, they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in the event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For all transactions up to £10 a deposit fee of 1/- is charged; on transactions over £10 and under £50 the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/8; and on all transactions over £100, one-half per cent. All deposit matters are dealt with at Dorset House, Stamford Street, London, S.E.1, and cheques and money orders should be made payable to Iliffe and Sons Ltd.

## CAMERAS AND LENSES

**1-PLATE** Adams' Tropical Minex, fitted with Ross 2 Combinable set, single components, 10 $\frac{1}{2}$ , 11 $\frac{1}{2}$ , 12 $\frac{1}{2}$ , 14 $\frac{1}{2}$ , 6 teak book-form slides, Wratten K 1 $\frac{1}{2}$  and K 3 screens, solid hide case; outfit unsold; cost £164; offered at £75, or near offer. —Seen at 113, Queens Rd., Bayswater, W.2. [9280]

**THORNTON-PICKARD** Horizontal Reflex, 3 $\frac{1}{2}$ ×2 $\frac{1}{2}$ , f/4.5 Dallmeyer anastigmat, splendid condition, little used, complete with 12 slides, F.P.A. and leather case, £5/10; deposit system if desired. —Mardon, Thorley Hill, Bishop's Stortford, Herts. (Phone 338.) [9386]

**TELEPHOTO** Outfit.—1-pl. Thornton-Pickard Reflex, revolving back, with 12-in. f/5.6 Dallmeyer Dallon, in very good condition, complete with 12 slides, F.P.A. and leather case, £10/10; deposit system if desired.—Mardon, Thorley Hill, Bishop's Stortford, Herts. (Phone 338.) [9387]

**£7/10** 1-pl. T.-P. Junior Special Reflex, f/3.5 Dallmeyer, focal-plane 1/10th to 1/1,000th, complete with slides, F.P.A., R.F.A., filter, exposure meter, 56-in. wooden tripod, case.—Box 5394, c/o "The Amateur Photographer." [9469]

**3×4 cm.** Foth-Derby, f/3.5, D.A. focal-plane, leather case; cost £5/5 July; giving up, £4/10.—BM/CLGL, W.C.1. [9471]

## WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

## CAMERAS AND LENSES

**VOIGTLANDER** Brilliant, f/4.5 Skopar, Compur; in perfect condition, with leather case, £4/15.—BM/TKCP, London, W.C.1. [9473]

YOU CAN DEAL IN PERFECT SAFETY THROUGH OUR DEPOSIT SYSTEM.

## THESE NORFOLK CAMERAS are now PRE-EMINENT!

### NORFOLK

3½×2½ Plate and Film-pack Camera (also adaptable for roll-film), constructed of a light but strong alloy. Double extension, actuated by rack and pinion focussing movement. Raising and cross f-onts by micrometer movement.

Superior quality bellows, clear and direct-vision view-finders. Zernar anastigmat lens, giving very superior definition even at full aperture, fitted in latest type delayed-action Compur shutter, complete with focussing screen, 3 single metal slides, antinuous release. The whole in superior finish.

With f/3.5 Zernar anastigmat lens in delayed-action Compur shutter.....

**£7:7:0**

Or 9 monthly payments of 17s. 2d.  
F/2.9 Zernar anastigmat in delayed-action Compur shutter.....

**£9:9:0**

Or 9 monthly payments of £1 2s. 1d.

### NORFOLK

### ROLL-FILM 3½"×2½" Model

1 Metal body of light alloy, solid construction.

2 Best leather bellows

3 Compur shutter, speeds 1 to 1/300th sec., with delayed action.

4 New clear glass direct-vision type view-finder is now fitted at the side of the camera (not as illustrated) with neat mask device for half-picture, adjustable at will.

5 Latest self-erecting device. (Press of a button brings the camera immediately into action.)

3½×2½ Roll Film Model, also with interchangeable masks for 16 pictures 4½×6 cm. Fitted with automatic covers on film windows for use with pan. films. Ingenious clear-type finder with automatic spring mask for half-picture size. Sturdily constructed, neat design, f/3.8 Zernar, Compur delayed-action shutter....

**£6:6:0**

Or 9 monthly payments of 14s. 6d.

### The NEW BAKY

The perfect miniature camera at a most reasonable price. Well designed and constructed, self-erecting, takes standard 3½×2½ film, 16 pictures 4½×6 cm. Automatic film window covers for use with pan. film. F/2.9 Schneider Radionar Compur D.A. shutter....

**£6:15:0**

Or 9 monthly payments of 15s. 9d.

Now fitted also with new type Compur, speeds up to 1/400th. **£7:15:0**  
Or 9 monthly payments of 18s. 1d.

## SPECIAL ENLARGER OFFER

For this small amount every purchaser of a 1935 T.-P. Imperial  
Enlarger from me may have it adapted to take single film  
negatives of any size up to 4"x4" and IN  
ADDITION to take the 2/6 particular size film you  
use IN THE STRIP and without scratching.

**'Imperial'** For use with  
gas or  
electricity.  
Beautifully polished Mahogany woodwork.

1-plate £5 : 5 : 0 (without lens).

Micrometer screw focussing front. Reversible negative carrier.  
Spring-controlled carrier guide. Bellows connection between  
lamphouse and condenser. Removable diffuser. A model  
whose simplicity, efficiency, and low price offers remarkable  
value. It is an ideal outfit for a beginner or advanced worker.

### PRACTICAL REMARKS

Finest definition and detail with unlimited magnification are  
alone obtained with a horizontal condenser-type enlarger.  
They also enable you to use your own lens, use lenses of differ-  
ent foci, and deal with all negatives 1-pl. size or less with equal  
precision. The best is not always expensive. Immediate  
delivery from stock carriage paid within the British Isles  
(Free State excepted). Order now and avoid disappointment.  
Advice on suitable lenses free.

## TALKING OF— SCREENS

HOW are you going to show your films this  
winter? Will you be content with your  
screen, giving what may be to you the  
maximum light or are you going to show films of  
professional brilliance by employing the new  
"ILLUSTRA" super-surfaced beaded screen?  
Decide now to purchase one of these new super  
screens. Well constructed and made with  
"Illustra" beaded screen fabric, your pictures  
will assume a lifelike clarity which you have  
hitherto thought impossible. "ILLUSTRA"  
Screens are low-priced.

26" x 36" £2 : 0 : 0	30" x 40" £3 : 10 : 0
36" x 48" £4 : 0 : 0	40" x 56" £4 : 10 : 0
56" x 72" £6 : 0 : 0	58" x 84" £7 : 10 : 0

EVERYTHING FOR MOVIES.—Films, 9-mm.,  
16-mm., 28-mm. and 35-mm. Silver Screens  
from 7/6

## THIRTEENTH EDITION

# WALL'S DICTIONARY of PHOTOGRAPHY

AND REFERENCE BOOK  
FOR THE AMATEUR  
AND PROFESSIONAL  
PHOTOGRAPHER

Edited and largely re-written by  
**F. J. MORTIMER**, Hon. F.R.P.S.

All the latest photographic  
principles are incorporated in  
the present edition, which  
includes up-to-date informa-  
tion on such recent develop-  
ments as infra-red, high-speed  
and colour photography. The  
volume provides practical in-  
formation in dictionary form  
on every phase of the subject  
—technical, pictorial, scientific  
and general, and is in itself an  
explanatory index to all terms,  
formulae, etc. Its contents are  
made readily accessible by the  
extensive use of cross refer-  
ences.

CLOTH BOARDS.  
CROWN 8vo.  
645 PAGES.

# The AMATEUR<sup>3D</sup> PHOTOGRAPHER & CINEMATOPHOTOGRAPHER

~ The Journal for Everybody with a Camera ~

Vol. LXXX.

Wednesday, October 2nd, 1935.

No. 2447.

*Fidelity to tone values*

is an outstanding reason why you should use Selochrome Roll Film. Other reasons are, exceptional speed and absence of halation, due to the multi-coating and special backing.

Made in England  
by  
ILFORD LIMITED,  
ILFORD, England.

**SELOchrome** *EXTRA FAST*  
Roll Film

IT'S INTERESTING—IT'S AMUSING—IT'S EASY!

# TO-NIGHT—AFTER DARK— take HOME SNAPSHOTS with the Kodak Night Photography Aids

Equipment has been further improved this year and the brilliant "Photoflood" Lamp now costs much less—reduced from 4/- to 2/6. All you need to make charming, informal home pictures is

KODAK SUPER SENSITIVE PANCHROMATIC FILM, plus *either* the "Photoflood" Lamp and "Kodaflector," *or* the "Sashalite."

## Kodak Super Sensitive Panchromatic Film

The film of lightning speed; six times as fast as Regular Film to artificial light. Made in Roll Film and Film Packs.

## "Photoflood" Lamp

New reduced price, 2/6.

Plugs into ordinary electric light socket; gives intense *continuous* light.

## "Kodaflector" Junior

Specially designed reflector for "Photoflood." Increases photographic efficiency of illumination, decreases necessary exposure times.

Supplied with stand, enabling it to be stood on chair, table, etc., or suspended from shelf or picture-rail, and 9 ft. of flex. 6/-

## Baby "Sashalite" Lamp

No smoke! No smell! No danger! Gives intense brilliant *flash*; the modern successor to flashlight. Fired by pocket torch battery. 10½d. each

## "Sashalite" Amateur Outfit

Consists of 2 Baby "Sashalite" Lamps, battery in holder, and collapsible reflector. 7/6

## How this picture was made.

Two "Photoflood" Lamps were used, one in lamp on shelf and one in "Kodaflector." The exposure was 1/20th second at f5.6 on Kodak Super Sensitive Panchromatic Film.

Write for free illustrated folder giving similar lighting diagrams and exposure details, and other useful tips.

# Rolleicord

## GETS ACTION WITH EASE

There's no need to take your eye away from the camera when you use a Rolleicord. The ground-glass screen shows you, like a living picture, all that is going on—the golfer about to drive—the diver ready to plunge—the horse preparing to jump—you can keep your subject in focus all the time, and when the "action moment" arrives—click! you've got it true to life. Rolleicord is fitted with one-lever Compur shutter, speeded to 1/300th sec., T. and B., and f/3.8 Zeiss Triotar lens. It takes 12 pictures on 8-exposure  $3\frac{1}{2} \times 2\frac{1}{2}$  roll film for 1/-, and may be adapted for plate back and many other Rolleiflex accessories. With leather-covered body (as illustrated).....£12 : 15 : 0

Also supplied with metal body, and f/4.5 Zeiss Triotar lens (for roll films only).....£10 : 10 : 0

Exakta Model A, f/3.5 Tessar, 2 filters, lens hood, ever-ready case. New condition	£12 17 6
IkoFlex, f/6.3 Novar, lens hood, case. As brand new	£5 0 0
Foth-Flex, f/3.5 lens. As new	£7 0 0
Voigtlander Virtus, f/3.5 Skopar, case. As brand new	£6 17 6
Kodak Nagel Pupille, f/2.8 Tessar, special coupled reflex attachment, 2 filters, lens hood, case. Cost about £25. First-class condition	£12 0 0
Voigtlander Superb, f/3.5 Skopar, ever-ready case. As new	£11 17 6

## WHAT BECOMES OF THE NON-MINIATURES?

Customers often ask us what becomes of the cameras we take in part-exchange for our miniatures. The answer is that in the vast majority of cases, we pass them on to the trade. We have, however, during the last twelve months acquired a small selection of really magnificent reflex and press outfits. These we shall be offering for sale in next week's *Amateur Photographer* at prices that will come as a surprise. Don't buy a reflex until you have seen our list next week.

Vol. LXXX. No. 2447.

OUR readers may not need to be reminded that the end of the present week sees the close of "Summer Time." There will probably be numerous references to the matter in the daily Press but for the photographer the matter has greater significance. In the ordinary working day he now becomes deprived of an hour of daylight, although, if he is an early riser, this may be made up for in the morning, but the effects obtained will hardly be the same. On the other hand, the longer evenings will give greater opportunities for various kinds of indoor photography that he might not attempt if there were still work to be done out of doors. The close of Summer Time may, therefore, be said to mark the beginning of the indoor season for the amateur photographer. We do not admit, however, that it means a "close time" for outdoor photography; this will continue throughout the autumn and winter months, and doubtless provide many fine pictures of a seasonal character.

### Traffic Lights.

The traffic problem may perplex the authorities and be a perfect nightmare to those who use the roads, but at least, as some pictures in the London Salon bear witness, it gives the pictorialist opportunities for unusual conceptions, decorative shapes, and quaint conceits. Road signs, beacons, traffic lights, and crossing markings may deface our streets, giving them the appearance of a railway track, but, treated judiciously, they can make first-rate elements in a pictorial composition. With the growth of illuminated traffic signs, too, night photography offers new effects. In Continental cities, in addition to

## TOPICS of the Week

*The end of the seaside season in Town. A snapshot taken at Bankside.*

the ordinary green, amber and red signals, they have glazed lights let into the pavement so that a strip of red illuminates the kerb when the pedestrian is not to cross, and this is succeeded by two parallel chains of green dots across the road when the passage is clear. It seems to us that by watching these and the timid shadows of people who obey them some night effects of a quite bizarre order might be forthcoming.

### The Bed of the Lake.

Submarine photography is little practised, on account of obvious difficulties, and the part of this world of which people know least is the region under the shimmering surface of water. A friend has brought back from his holiday in the Swiss mountains some unusual pictures of the lake bottom. The Swiss lakes, though often of great depth, appear deceptively shallow owing to their stillness and the pellucid clearness of the water. Going out in a boat on the lake, and holding his camera over the side, not pointing directly downwards, but diagonally so as to bring in the opposite shore, he succeeded in getting submarine pictures, more striking than beautiful, of life and vegetation below the surface and the litter of the lake bed. The objects look as if they had been photographed in a glass tank.

### Privateering not Allowed.

The public entrance lobby to the Assembly Hall of the League of Nations at Geneva (writes a correspondent from that city) resembles every day a camera auction room. There are set out on a table, under the watchful care of the police, cameras of all sorts and sizes, new and old, luxurious and workaday,

giants and lilliputians. They have been surrendered by visitors to the public galleries, people who thought it a good opportunity of adding the scalps of a few statesmen to their collection, and who knew that even if the lighting in the ordinary way was not good enough for their purpose the arc lights would be switched on at intervals for the benefit of the Press and the movies. But one and all the cameras have to be surrendered at the doors. At the same time, the League of Nations is most indulgent to photography for publicity. The British and French foreign ministers and all the other important speakers, when their turn came to mount the tribune, had to do so amid the glare and splutter of arc lights "which larned

them to be Hollywood stars." And the curious thing is that this sudden and erratic illumination is controlled by the photographers themselves from the little side gallery.

### "Cock-eyed" Prints.

Crazy borders seem to be the vogue for smart portraits on the Continent just now. The picture set primly in the middle of the frame, with an equal width of margin on either side, is a back number entirely, but so is the picture with unequal margins, pressed into one of the top or bottom corners, leaving a width of white band on two sides, like a cuff which has widely overshot the coat sleeve. In the new examples of portraiture the print has been slashed with the scissors, so that it may be pentagonal

or heptagonal, or anything except symmetrical, and then it is slapped on the mount with the eyes shut. The result is a craziness which simply draws attention to itself because it is new. The worst of new crazes in pictorial representation, as in other things, is that the more extreme they are the more violent is the reaction to conventionality afterwards. Just as in social behaviour the vogue of cocktail parties and so forth may presently lead to a return to propriety so absolute that Puritan England may well seem a mad and merry place by comparison, so in pictures the time may come when the representations in the family albums of a generation or so ago may appear to have been wildly dissolute.

## "The Amateur Photographer" EXPOSURE TABLE—October

EVERY MONTH a brief exposure table will be provided for the assistance of our readers in their practical work. A glance at the current approximate exposures as here given will serve as a reliable guide for most purposes. The subjects will be varied to suit the time of year. The following exposures will serve as a working guide for any fine day during the month, between the hours of 10 in the morning and 2 in the afternoon, with the sun shining, but not necessarily on the subject. Stop used, f/8. The exposure should be doubled if the sun is obscured or if stop f/11 is used. For f/16 give four times the exposure. For f/5.6 give half. From 8 to 10 a.m. or from 2 to 4 p.m., double these exposures. From 7 to 8 a.m. or from 4 to 5 p.m., treble them.

SUBJECT.	Ordinary.	Medium.	Rapid.	Extra Rapid.	Ultra Rapid.
Open seascapes and cloud studies .. ..	1/25 sec.	1/40 sec.	1/75 sec.	1/100 sec.	1/120 sec.
Open landscapes with no very heavy shadows in foreground, shipping studies or seascapes with rocks, beach scenes ..	1/15 "	1/25 "	1/45 "	1/60 "	1/75 "
Ordinary landscapes with not too much foliage, open river scenery, figure studies in the open, light buildings, wet street scenes	1/6 "	1/10 "	1/20 "	1/25 "	1/30 "
Landscapes in fog or mist, or with strong foreground, well-lighted street scenes ..	1/4 "	1/6 "	1/12 "	1/15 "	1/20 "
Buildings or trees occupying greater portion of pictures, river scenes with heavy foliage	1/2 "	1/3 "	1/6 "	1/8 "	1/10 "
Portraits or groups taken out of doors, not too much shut in by buildings .. ..	2 secs.	1½ "	1 "	1/2 "	1/3 "
Portraits in well-lighted room, light surroundings, big window, white reflector ..	6 "	5 secs.	3 secs.	2 secs.	1½ "

As a further guide we append a list of some of the best-known makes of plates and films on the market. They have been divided into groups, which approximately indicate the speeds referred to above. The hypersensitive panchromatic plates and films require less exposure than the ultra-rapid.

Ultra Rapid.		Rapid.

# The Advantages of Club Membership

The photographer who belongs to a

photographic society or camera club will not need to be reminded of the advantages of such membership. This article is addressed to the worker who is unattached, and the benefits are indicated, not forgetting those of the postal clubs.

AT the present time of the year, when most photographic societies are beginning their winter programme, a piece of good advice to any photographer, whether he or she is a beginner or a more advanced worker, is to join up with the nearest society. It is safe to say that most amateurs who are leaders in photography are the first to admit that they owe much to the help received from this source.

Proof of the value of photographic clubs will be found in the comments of contributors to the "How I make my Exhibition Pictures" series in this journal. Grateful acknowledgments to clubs and to their fellow-members are continually appearing, and stand as a record of progress from the leading pictorialists.

The advanced photographer derives stimulus from contact with others; the beginner has his difficulties explained to him, and help given at any stage of his progress.

## The Beginner.

It is sometimes thought that the photographic societies cater only for the advanced worker, but this is not the case. It is recognised that the object of most societies is to foster and encourage an interest in photography, and the beginner of to-day is the leader of the not far distant to-morrow. So let no beginner think that he will not be welcomed at his local club.

Although most camera clubs run a weekly programme of lectures of the "popular" type, they also have practical demonstrations, and it is from such as these that the beginner can learn much.

While it is easy to grasp the principles of a printing process, and to learn the working of that process entirely from photographic literature, it is much easier to follow it after seeing it done practically.

After becoming a member of a

photographic society, the next meeting should be attended. The newly-elected member should make himself known at once to the secretary, or other officials who may be present. He should not be backward in doing so, as he may be quite certain that they will be watching for him.

Introductions will be made to other members, and the new-comer will feel at home. He will soon find that there are others who share similar interests, and ideas are exchanged and hints given to mutual advantage.

## The New Member.

The new-comer should support the club in every way; by regular attendance at meetings, by entering prints or slides in the various competitions, and so back up the efforts of the officers for the common good.

There is also the social side of photographic society life. Many clubs extend their activities by means of rambles and visits to various places of interest, so that the beginner need not think that it is all club and dark-room work. Many friendships have been made through the medium of the camera clubs amongst those who may never have met otherwise.

## Dark-rooms and Enlargers.

Most of the larger photographic societies have their own dark-rooms, fitted with up-to-date apparatus for enlarging. This is of immense benefit to those whose domestic circumstances are not conducive to photographic work.

In some cases there is equipment for portraiture, in the form of studio lighting apparatus, together with backgrounds and cameras, etc. This is an inducement to any keen photographer to widen his activities. Many societies, as an additional activity, also run an amateur ciné section.

The photographer who is resident in a country district where

access to a camera club is impossible, has the solution of his problem in the postal clubs, of which there are a number. These cater for photographers of various degrees of proficiency and interests, from pictorial work to nature study, or for the miniature camera enthusiasts.

The members are linked up by circulating portfolios, to which all contribute. The friendly criticism and advice cannot but be helpful to the keen photographer. Many friendships have been made through these clubs, although the respective members are situated at long distances apart.

A complete up-to-date list of photographic societies, including postal clubs, will be found in *Photograms of the Year*, published annually in December.

## Exhibition Work.

Nearly every society and club arranges for an exhibition to be held annually, during or at the end of the winter session. This provides an incentive for all members, both new and old, to derive the utmost from every lecture and demonstration, so that their prints will show the benefit of such instruction to their individual advantage and that of the exhibition.

Some clubs, realising this educational value of exhibition work, organise more frequent shows in the nature of monthly competitions. These events, especially if they are followed by sound, constructive criticism, are a constant help and stimulus to keep the members always on "tip-toe" with enthusiasm and interest.

Lastly, having joined a society, the new member should do all he can not only in the matter of attendance at lectures and demonstrations, but later, in helping other new members who may be beginners as he was.

# Early Morning Autumn Sunshine

By F. L. RICHARDSON.

TO be out and about on a fine sunny autumn morning is a pleasure that everyone appreciates; one feels well, sees well, and when a camera is carried and used, does well, for the shortest of walks amongst buildings and trees at this time will provide pictures in abundance.

Sunlight and shadow are subjects that all artists revel in, and here they can be seen at their best and at every turn. If there is any difficulty at all in morning photography it is mostly felt when choosing viewpoints; not in the sense that one will wonder from what point to take a certain scene, but which scene to take. It will be found only too easy to shoot off a roll of film or half a dozen plates without moving more than a few yards away from some attractive spot, so that it is well to carry a reserve of negative material just in case.

Too much sunshine is not good policy. The best scenes to take are those that contain a good deal of shadow and half-tones with just a splash or streak of sunlight to provide a point of attraction; but, of course, there is no definite standard of proportions, that depends on the kind of subject, but in any case the foreground should be shady, and, if it is at all

*Autumn morning.*

result—under-exposure. An actinometer is the surest guide.

The fastest plates or films are best for this contrasty work, for they are naturally softer than those of slower speed. Even with ordinary development they will produce wonderfully well graded negatives. But, of course, you will cut it down to about two-thirds of the normal time. If this is not done they might be found difficult to print from, especially those negatives that show both deep shadow and a portion of the sky.

When plates are used it is a simple matter to develop according to the contrasts of the subject, but when films are used it is not so simple. There is a way, however, if it is proposed to return again to the scene, as I think it will be, and that is to leave the more contrasty scenes for a time until several of them have been found, and then to take them all on the one roll. When this roll is subsequently developed in consideration of the contrast, it will be found to compare equally with the more normal ones and printing will be considerably simplified.

If there is not actually mist, there is often a slight haze on early autumn mornings. Good use can be made of this, as it suggests distance, helps to conserve interest in the foreground, and makes one's pictures more descriptive. The use of a colour filter will destroy the effect of any present, as also will over-development of the negatives and under-printing. Otherwise, provided it is introduced into suitable scenes, its presence makes these morning pictures "live."

*A street scene.*

possible, the other edges of the picture. This condition can usually be managed by stepping a few paces to left or right, and thus bring into view foliage or the corner of a building.

A great deal of contrast is evident in such subjects, so that no more exposure should be given than is necessary to record detail in an average shadow. The sun itself has no effect upon shadows. If the remainder of the sky is clouded over and an exposure for bright conditions is given, there can only be one

*Arring baby.*

# BROMIDE PRINT QUALITY

## —How to Ensure it

The difference between good bromide prints and those of poor quality depends upon the observance of the points dealt with in the following article.

IN these days of small cameras bromide papers are easily the most popular printing material. Unfortunately, a great number of prints are produced that are of poor quality.

It should be easy for the amateur to make a perfect bromide print, either by contact or through the enlarger, as there is no printing process which offers the worker more control over the result, in view of the great range of material provided.

Further, the recent improvements in these papers allow for the most exacting requirements. There are, however, various factors which have bearing upon the quality of the print, and these must be observed if the finest results are wanted.

### *The Paper and the Negative.*

Obviously, the paper should be one which is suited to the contrast of the negative, which is not a difficult matter when the variety of papers available is considered.

The ideal plan, although it is admittedly a counsel of perfection not often followed, is to make the negative of the right contrast to meet the needs of the paper in use. This is of special importance when the photographer favours a particular paper of definite character in the matter of the colour of the base, or of the type of surface.

With regard to the finest print quality, this will be given by the "normal" grades of paper, and from good negatives. The "slow" or "hard" grades, made for negatives which are weak in contrast, will not satisfy the critical worker who requires a hint of tone in the highest lights, and a suggestion of detail in the deepest shadows.

In other words, there should be no part of the print where light action is not evident, and no part lost through excessive contrast or over-exposure.

### *Exposure.*

Next in importance to the choice of the right grade of paper is the correct exposure of the print. Proper exposure means that the high-lights will show full tonal quality, but not at the expense of the shadows.

It is sometimes argued that bromide papers have latitude in exposure, but

this does not mean that the photographer who values the quality of his work can be careless in the matter of correct exposure.

The best way of ensuring this is to expose a trial piece of paper with the negative in the printing frame or enlarger, for various times, say, five, ten, fifteen, twenty and twenty-five seconds. The strip is developed until the action will go no farther, and when examined the correct exposure for the negative will be indicated.

### *Developers and Development.*

Most standard developers work well with bromide papers, amidol being preferred by many workers. Good results will be obtained with a well-balanced M.Q. developer, but the worker who has any doubts in the matter will do well to use the developer recommended by the maker of the paper that he is using. These differ in minor respects, but the following, founded on a number of formulae issued by the leading makers, strikes an average that can be regarded as eminently satisfactory:

Metal .. ..	16 grs.
Hydroquinone .. ..	60 grs.
Sodium sulphite (cryst.)	1½ oz.
Sodium carbonate (cryst.)	1½ oz.
Potassium bromide ..	5 grs.
Hot water .. ..	20 oz.

Dissolve the metal in half the hot water and add half of the sulphite. Then dissolve the hydroquinone and add the remainder of the sulphite. Make up to 20 oz. with hot water and finally dissolve the carbonate and bromide.

For use, dilute with equal quantity of water and use at 65° Fahr. This developer will keep well for months in full, well-corked bottles.

The above developer diluted with six to eight times the quantity of water and double the amount of bromide added will produce very soft and dainty results with over-exposed prints. The adjustment of the dilution to the exposure is, however, a matter for experiment, and is worth trying for special effects.

The fixing bath for bromide prints should consist of:

Hypo .. ..	4 oz.
Water .. ..	20 oz.
Potassium metabisulphite	½ oz.

Development is obviously important. The exposure of the print will control its depth. The developer will control the colour, and the quality. The bromide print should be so exposed that development will produce an image of the right depth when its action seems to stop.

The print should be allowed to remain in the developer for at least twice as long, or carried to finality, or for not less than two and a half minutes. This will not affect the depth of a properly exposed print, but will ensure that it is of good colour.

### *Poor Prints and Toning.*

Over-exposure means that the print will develop too fast, and if it is rushed out of the developer in the hope of saving it, it will have muddy tones and rusty blacks. There are many bromide prints which are entered in competitions and exhibitions which bear every evidence of this.

If the print is to be sepia-toned, it is very important that development should be full. Over-exposure and insufficient development result in the unpleasant yellowish tones so often seen in toned prints. Sepia toning is only for good prints, and most certainly must not be regarded as a means of saving bad ones.

A final word, the developer should be fresh, and not used for more than two or three prints. The solution may appear working well, but it is no longer the same in its composition by reason of the result of its action on former prints. The use of an exhausted developer is sufficient to cause that almost indefinable lack of quality so frequently seen in bromide prints.

### *Paper Quality.*

When selecting a bromide paper it should not be overlooked that tone and texture may make or mar the picture. For instance, a cream-base paper will look wrong for snow and winter scenes, and miniature negatives that disclose too much grain when enlarged should be printed on a rough surface paper; a smooth or glossy paper will only accentuate the defect.

It need hardly be said that the best prints can only be made upon good papers by makers of repute.

October 2nd, 1935

# The INDOOR

By DONALD G. SHELDON

ferred, not only on account of its greater sensitivity to artificial light, but also because of the truer rendering of the tone values of coloured objects.

The chief difficulty confronting beginners in indoor work is in finding the right amount of exposure to give for the lighting and materials used. Some little help may be got from exposure tables and meters, and from data supplied with films or in articles in the photographic Press. These are useful for a start, but there is nothing so valuable as the experience accumulated by experiment. A few films or plates will be wasted at first, but if full records are kept they will be wasted in a good cause, for the errors can be corrected the next time.

"Back to Sun Time." Panatomic film, photo-flood lamp at 5 feet, 2 secs. at f/11.

HOLIDAYS are over, the clock is back to sun time, daylight is becoming shorter in duration and poorer in actinic value. For many of us, outdoor photography has now become an affair of occasional half-holidays, weather and light permitting. Some call it the "end of the season." They're wrong—the indoor season has just begun.

There are many camera-owners who have never tried indoor photography on account of some mistaken notion that it is difficult. Some kinds of indoor work yield results easily and with much greater certainty than the casual snapshotting of the holidays.

In most cases, pictures can be planned in detail beforehand and can be retaken if unsuccessful, which is certainly not the case with the majority of outdoor failures. Moreover, the keeping of records will enable the circumstances of successful pictures to be repeated as often as desired.

The matter of equipment is one which need deter no one. Almost any camera will take indoor pictures if handled with knowledge and common sense—even the humble box roll-film camera. A shutter which will give a "time" exposure is essential; that is why I said "almost any camera," for a few of the cheaper box cameras have "snapshot only" shutters. Elaborate lighting sets are a luxury, but quite unnecessary in many cases. Where electricity or gas is not available, flashpowder or bulbs will take their place for living subjects, while oil lamps or even candles will produce fully exposed negatives when long exposures on still subjects are possible.

The materials used will depend upon the camera, but whether plates, film packs or roll films be used they should be speedy, and be backed to prevent halation. Those accustomed to using "ordinary" films should transfer to one of the double-coated, backed kinds, such as the various "chrome" films.

When artificial lighting is to be used, panchromatic material should be pre-

"Tea Time." Verichrome film, daylight (dull), 5 p.m., K2 filter, 10 minutes at f/16.

"First Violin." Panatomic film, daylight and photo-flood lamp, 1/2 sec. at f/4.5.

Portraits, "home-life" groups, interior views, and "still-life" studies will each provide plenty of practice and amusement for the enthusiast. The novice will often tackle portraits of his friends and family for a start, and the matters of suitable background, pose, and lighting will be a little puzzling at first. The subject is too large to be described in detail in this article, but is frequently dealt with in the pages of this journal. Whether daylight or artificial light be used, the background should be as plain as possible, and the pose natural and not strained.

In most houses a section of plain wall can be found for use as a background, or, failing this, a tightly stretched blanket of medium hue may be used. Patterned wallpapers and creased white sheets should be avoided like the plague. Experiments should be made with various strengths, positions, and kinds of lightings, with and without shadows cast on the background.

# OR Season

Where electricity is available, one or more Osram "Photoflood" bulbs, costing 2/6 each, will solve the problem, and if used only for actual exposure (not during the arrangement of the subject) will last two or even three seasons. If there is no electricity, flashpowder or flashbulbs will take its place, giving excellent results if used with reflectors for lightening harsh shadows.

Interior views (without figures) form another branch of indoor photography. Architectural studies in churches and other large buildings will usually have to be taken during the hours of daylight; and though the light may be poor, long exposures can be given to compensate for this. In the home, the usual lighting may be supplemented by extra lights or by flashlight.

"Breakfast Time." Panatomic film, daylight and two 60-watt bulbs, 1 minute at  $f/22$ .

outside, because of the absence of wind and better control over lighting conditions. The arrangement of the material is the most difficult part of the procedure; next to this comes the recognition of what is superfluous and of the need for drastic trimming of the results.

For still-life work there is no need for powerful lights. I habitually use two low-power electric bulbs with or without daylight, and with sheets of newspaper to act as reflectors. Avoid the temptation to work close to the group in order to get a large-scale image; the effect is to make the nearer object much too large in proportion to the more distant ones, and sharp focus on all planes becomes increasingly difficult.

When the camera has a focussing screen this is an advantage, as the picture may be inspected and the arrangement and sharpness of the components of the picture checked before exposure. If no focussing screen is fitted, distances should be checked accurately by means of a tape measure, as even slight errors in focussing may ruin the result.

"His Own Hearth." 10 secs. at  $f/8$ , ordinary room daylight, 100-watt bulb at 2 yards and 9 in. magnesium ribbon in fireplace.

"Still life" is a most fascinating branch of indoor work, and the term may be taken to include much more than the conventional bowl of fruit in front of a plush curtain, which seems to be the accepted notion in some quarters. Every household or place of business will provide subjects galore if only we can see them. Nature subjects, too, such as studies of flowers, foliage, insects, etc., can often be done better indoors than

"The Village Church." Panatomic film, 1 minute at  $f/16$  at midday.

# NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

The Royal Photographic Society is again arranging for an Exhibition of Cinematography. This will follow the Annual Exhibition now open at the Society's House, 35, Russell Square, W.C.1. It will be held from Monday, November 11th, to Saturday, November 30th. In conjunction with this exhibition a sub-standard film competition will be held, open to amateur and professional workers alike. The prospectus of the exhibition and competition is now available, and will be sent on application to the Secretary, R.P.S., at the above address.

We hear from Granville Gulliman and Co., Ltd., of Leamington Spa, that Mr. Gordon Lock, Chantry Lane, Grimsby, and Mr. J. L. Robson, 48, Warwick Road, Carlisle, have now become wholesale stockists for the firm's products for the convenience of customers in their respective localities, and a full range of Granville Gulliman specialities is being carried by them.

Our associated weekly journal, *The Farmer and Stock-Breeder*, with the largest circulation of any journal devoted to agriculture, is making an important advance in its service to readers. As from the issue on sale on Tuesday, October 1st, under the title of "The Farmer's Home," a 16-page supplement in photogravure will be included every week with each copy. This supplement will include four full pages of beautifully reproduced topical and farming pictures, together with features dealing with wireless, cookery, fiction, fashions, furnishing, homecrafts, gardening, needlework, knitting, and a children's feature, the whole being profusely illustrated. The serious farming news and information will, of course, be included as

usual in *The Farmer and Stock-Breeder*, which has rendered an unexampled service to farmers since the paper was established in 1843. The price remains at twopence per copy, complete with supplement.

The Hon. Secretary of the Guildford and District Camera Club, Mr. G. B. Eden, writes to tell us that in future his address will be Kitsilano, Meads Road, Boxgrove, Guildford. He also informs us that during the past year this new Club has acquired a dark-room and doubled its membership. Any amateurs residing in the neighbourhood should certainly get in touch with Mr. Eden. The winter session of the Club opens on Tuesday, October 8th, with a lecture by Mr. C. L. Clarke, Secretary of the Kodak Fellowship. This will be given at the Abbot's Kitchen, North Street, Guildford, at 7.45 p.m.

The Camera Company, of 320, Vauxhall Bridge Road, Victoria, London, S.W.1, announce that their annual sale commences on October 2nd. Many hundreds of bargains will be offered at this sale. Further particulars are obtainable upon application.

The Ilford Amateur Ciné Society was started in the winter of 1934 by a few enthusiasts and during the months that have passed has grown beyond all expectations. The Committee have booked accommodation for meetings at the Gatehouse Café, Cranbrook Road, Ilford, and the first is to take place on Thursday, 3rd October. At this meeting a film and lecture will be given by Mr. Bolitho of Messrs. Cinécraft, after which some members' films will be reviewed and discussed. It is hoped that any amateur cinematographer living

on the east side of London will get into touch with the Secretary of this virile Society, not only to strengthen its numbers, but also to help himself to improve his film work. The Secretary is Mr. A. D. Taylor, and his address is 9, Middleton Gardens, Ilford. He will be pleased to assist any enquirer to the best of his ability.

The Service Co. (London), Ltd., of 289, High Holborn, London, W.C.1, has just issued a new illustrated catalogue of roll-film, reflex, focal-plane, enlarger and ciné bargains. There are some popular lines at highly attractive prices. If *The Amateur Photographer* is mentioned, this illustrated list will be sent post free on application to the address quoted above.

Ilford Ltd. have just put on the market a new Selo 9.5-mm. Reversal Ciné Film. Exceptionally fine grain is claimed for this film with high speed. It has an anti-friction coating and is on a blue tinted base to ensure better black-and-white quality. The base is exceptionally strong and is made to ensure perfect register. It is suitable for every standard type of 9.5 ciné camera and projector. It is sold in 30-ft. chargers at 5s. 6d. including free processing. We hope to make further comments on this film after testing it. In the meantime, readers who are interested in this size should apply to Ilford Ltd., Ilford, for further particulars.

A new series of the popular little booklets, "The Photo-Miniature," are being issued. They are published in an attractive yellow and red cover, and three have already appeared: (1) "Speed Photography"; (2) "Physical Development"; (3) "Pinhole Photography." Tennant & Ward, New York, are the publishers, and the British Agents are Ensign, Ltd., High Holborn. The new "Photo-Miniature" costs 40 cents, or 1s. 8d.

## Exhibitions and Competitions

CURRENT AND FUTURE.

Notices of forthcoming exhibitions and competitions will be included here every week if particulars are sent by the responsible organisers.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers. Entries, October 31. Rules in issue of September 25. California Pacific International Exhibition, San Diego.—May 29–November 11. Miss Ruth Kilbourne, Secretary, Exhibition Headquarters, Balboa Park, San Diego, Cal., U.S.A.

Paris International Salon.—October 5–20. Secretary, M. E. Cousin, 51, Rue de Clichy, Paris.

London Salon of Photography.—Open, September 14–October 12. Further particulars from Secretary, London Salon, 5a, Pall Mall East, S.W.1.

R.P.S. Annual Exhibition.—Open, September 14–October 12. Further particulars from Secretary, 35, Russell Square, W.C.1.

Irish Salon (to be held at Mansion House, Dublin).—Open, November 2–9. Particulars from Hon. Secretary, Irish Salon of Photography, 18, Morehampton Road, Dublin.

Rotherham P.S. International Exhibition.—Open, October 16–19. Hon. Exhibition Secretary, E. George Alderman, Ruardean, Newton Street, Rotherham, Yorks.

Indian International Salon (promoted by Camera Pictorialists of Bombay).—Open, November 17–30. Hon. Salon Secretary, F. R. Ratnagar, Central Bank Building, Fort, Bombay, India.

G.W. Kly. "Camp Coach" Holiday Competition.—Prize, one week's holiday in camp coach during

1936 holiday season. Photographs should depict any aspect of camp coach holiday. Entries due, October 31. Further particulars from Superintendent of the Line, G.W.R., Paddington Station, W.2.

Canadian International Salon, National Gallery of Canada, Ottawa.—November 6–21, and afterwards in other Canadian cities. Entry forms and further particulars from Exhibition Secretary, Canadian International Salon, National Gallery of Canada, Ottawa, Canada.

Seventh Western International Photographic Salon.—November 23–30. Entries close, Monday, October 28. Particulars and entry forms from the organising Secretary, W. H. Hill-Muchamore, 24, Church Road, Redfield, Bristol, 5.

Cape of Good Hope International Salon (under the auspices of Cape Town P.S.).—Entries due, November 19; open, January, 1936. Hon. Salon Secretary, Richard Dekenah, P.O. Box 2431, Cape Town, South Africa.

IXe International Kertsalon Fotografische Kring "Iris".—Open, December 22–January 5, 1936. Entries close, November 15. Particulars and entry forms from J. Van Dyck, Secretary, "Iris," 69, Ballaerstraat, Antwerp.

Third (Second International) Wilmington Salon of Photography.—Open, January 6–26, 1936. Last day for entries, December 15, 1935. Particulars and entry

forms from the Salon Committee, Delaware Camera Club, P.O. Box 818, Wilmington, Delaware, U.S.A.

Leicester P.S. International Exhibition.—Entries, January 24, 1936; open, February 24–March 7, 1936. Exhibition Secretary, H. Foscutt, 19, Doncaster Road, Leicester.

The 40th Annual Exhibition of the South London P.S.—Open, February 15–March 14, 1936. Entries close, January 21. Further details and entry forms from Hon. Exhibition Secretary, H. S. Adams, 40, Stockwell Park Road, London, S.W.9.

Scottish National Salon.—February 8–29, 1936. Entries close, January 11. Particulars and entry forms from the Hon. Salon Secretary, Norman G. Brown, 36, North Lindsay Street, Dundee.

Ilford Photographic Society.—Annual Photographic Exhibition. From Monday, March 2, to Saturday, March 7, 1936. Closing for entries, Saturday, February 1, 1936. Particulars and entry forms from E. G. Roughton, 63, Havering Road, Romford, Essex.

Ville Salon International D'Art Photographique de Bruxelles, 1936.—Open from March 21–April 5, 1936. Entries close, February 25. Particulars and entry forms from M. M. Devaivre, 152, Rue Maréchal, at Brussels 3, Belgium.

Darwin Exhibition of Photography.—April 20–May 2, 1936. Entries close, March 19. Particulars and entry forms from the Secretary, J. H. Woods, South Down, Polton Road, Darwin.

## SUPER NETTEL

The Miniature Camera  
for the Pocket

The Super Nettel uses the well-known 36×24 mm. (1½×1 in.) perforated cine film in spools for 36 exposures. It is, as one would expect with an instrument bearing the Zeiss Ikon trade mark, beautifully made, and in the highest precision class. Zeiss lenses, metal focal-plane shutter 1/5th to 1/1,000th second, coupled range-finder, detachable back and a choice of Zeiss lenses. For those to whom the interchangeability of lenses makes no appeal the Super Nettel is an ideal instrument.

With Zeiss Triotar f/3.5. ....£18 12 6  
With Zeiss Tessar f/3.5. ....£22 5 0  
With Zeiss Tessar f/2.8. ....£24 15 0

The Super Nettel takes the well-known Contax spools for 36 exposures. These are available in Pernox Orthochromatic and Pernox Panchromatic, also in other makes of emulsions. Zeiss Ikon Products are stocked by most good camera shops. Name and address of nearest dealer on request.

ZEISS IKON LTD., 11, Mortimer House, Mortimer Street, London, W.1

GOOD-BYE  
TO ALL  
THAT . . .

—WHEN YOU BUY A

# Rolleiflex

## ROLL-FILM MIRROR REFLEX

No more "lugging" around of tripods and clumsy paraphernalia—Rolleiflex is light and compact, and there's no need to remove it from its ever-ready sling case to get snapshots in any light and weather. Then there's your material—bulky parcels of plates do not add to your comfort. With Rolleiflex you can carry enough material in your pocket to make 72 exposures. There's no chance of wasted film either, because Rolleiflex shows you your picture full size and right way up on the ground-glass screen, thus you are certain of perfect composition. A turn of the focussing knob is all that is required to get your picture dead sharp. Its one-lever Compur shutter, speeded to 1/500th sec., T. and B., and Zeiss Tessar f/3.5 lens make Rolleiflex the fastest roll-film mirror reflex in the World. It is designed to take plate back and numerous other accessories. Takes

12 pictures on 8-exposure 3½×2½ roll film for 1s. £22 10 0

**THE NEW MODEL IIIa  
LEICA**

Shutter Speeds  
1 to 1/1,000th sec.

The Precision Camera.

F/2 Summar, automatic focussing, interchangeable lens mount, all chromium plated **£43:0:0**  
Nine monthly payments of 100/6.

**THE NEW SUPER IKONTA**

Takes 11 pictures 2 1/2 x 3 1/2 on standard 3 1/2 x 2 1/2 roll films. Body of hard aluminium alloy, with hinged back. Leather covered, leather bellows. Weighs only 19 oz.

Special device to avoid double exposures, latest pattern distance meter coupled to lens focusing. f/3.5 Zeiss Tessar anastigmat, Rapid Compur shutter, speeds 1 to 1/400th sec., T. **£25:5:0**  
and B. Nine monthly payments of 58/11.

**THE NEW  
ROLLEICORD**

F/3.8 Zeiss Triotar anas., Compur shutter, speeds 1 to 1/300th sec., T. and B. **£12:15:0**

Nine monthly payments of 29/8.

The new Rolleicord takes 12 pictures on standard 3 1/2 x 2 1/2 roll films, and is also adapted to take the Rolleiflex plate back and other Rolleiflex accessories, excluding the cine film attachment and angle mirror.

**THE LEITZ  
"FOCOMAT"  
ENLARGER**

With Automatic Focussing.

Takes the standard 5-cm. focus Leica lens, screw-in fitting, automatic focussing adjustments scaled from 2 diameters up to 10 diameters. Will take negatives 18x25 mm., 24x36 mm., 3x4 cm., and 4x4 cm. Metal masks can be supplied for any of these sizes.

**£16:6:6**

Nine monthly payments of 38/1.

**LEITZ VALOY ENLARGER**

**£9:11:6** Nine monthly payments of 22/4

# How I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CCCI.

Mr. WARD  
HUTCHINSON.

From information communicated to our Special Representative.

"PHOTOGRAPHY came at last to supply a need which man must have been feeling almost since he first walked upright. This was to be able to see things reproduced exactly as in reality, and though photography does not quite achieve this, yet it does represent most faithfully the visible world in all its detail.

"This desire was something quite different from man's desire to create forms in art, although the two have been intimately bound together. I believe that the coming of

photography liberated the artist from the bondage of representation, of illustration, which was an infinite labour to him, and inevitably imperfect, and left him free to other realms bounded only by his imaginative vision.

"It will, therefore, be understood that all photography which is not 'straight' is a horror to me. Both 'art' and photography answer fundamental human wants, but a photograph tampered with and retouched to make a 'picture' is to me only a sorry travesty. I believe that

those who use photography as a sort of short cut to the creation of 'works of art' betray both their fine medium and their own integrity as creators.

"Inevitably, therefore, all my prints are straight enlargements. I use only a Leica camera, and develop my lengths of film by the time and temperature method in a Correx tank. This allows very little latitude in the matter of controlled development, and most of my films are developed approximately the same amount—that is, about three-quarters of the time recommended at any given temperature for the fine-grain developer.

"I like vivid subjects with well-disposed contrasts, since, for me, photography in monochrome is essentially the studied and skilful revelation of the manifestations of light on masses and in atmosphere, accentuated and vivified by shadow. It is also the only medium by which texture can really be rendered. And so I like to over-expose, which with short development gives me negatives that for printing rarely seem to require anything but my favourite Kodak Royal Medium.

"Where the whole—or almost all—of one film consists of particularly contrasty subjects, I then develop for only two-thirds of the proper time, and although I sometimes want 'contrasty' paper for a print, I rarely seem to choose 'soft.' It has seemed to me that a softly developed negative printed on medium or even contrasty paper, if necessary, gives a much more satisfactory print than a harder negative on soft paper.

"During the whole process of preliminary soaking in water, development, rinsing and fixing in the tank, I maintain a constant temperature (usually nearer 70 degrees than 65 degrees), but, as I prefer to leave the film to wash in running water, I gradually adjust the temperature after fixing to that of the tap-water.

"As to my prints, until now I have produced only bromides, and although *à la Leitz* my enlarging is quite orthodox."

(A further example of Mr. Hutchinson's work is reproduced on one of the centre Art pages.)

BUSINESS OR PLEASURE ?

Ward Hutchinson.

# Pictorial Analysis

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"HIGASA," by K. Wakasa.

HIGHLY characteristic of the Japanese feeling for decorative design and notable for its excellent technical quality, the subject of our discussion this week, which is another reproduction taken from the exhibition of the London Salon of Photography, is interesting also in its employment of a shadow, instead of a reality, as the centre of interest.

The expedient, perhaps, has been tried before, and has met with no small measure of success, but, as far as our recollection extends, it has not been done in precisely the same way, nor can it be said that this effort owes anything to its predecessors. The majority of such cases displayed a *cast shadow* of an object either excluded entirely or only partially shown, but not a *silhouette* of a figure that would be visible but for the intervening screen of the parasol. The idea is highly ingenious, and has the effect of exalting the design or pattern to the extent that it becomes the pictorial motive, whereas, if the parasol were reversed and were made to become a setting for an actual figure, the figure itself, and not the design, would be the main attraction.

Nevertheless, the arrangement, viewed as a composition, would be the same in both cases, but the centre of interest in the alternative would be concrete, and, as the subject stands, it is inclined towards the abstract. The shadow (1) still retains something of the primary importance that a figure so placed would acquire, chiefly on account of the suggestion of human interest, but, as an element in the design, it attains significance, in the first place, because it is the largest mass of coherent tone, and, in the second, because of its position on one of the intersections formed by divisions of thirds. These two factors endow it with principality, but its dominance is further stressed by its enclosure within the periphery of the parasol.

The ribs of the parasol provide a formation of the radial type. In the usual run of such arrangements, the tendency is to attract the attention to the centre, but, failing the existence of any feature of importance there, it is directed towards the circumference or what it encloses.

Besides acting in this way, the formal shape of the parasol also has

of pattern—from becoming unduly insistent or so nearly equivalent as to diminish the interest. It lends point and emphasis to the scheme, and, in conjunction with the character of the subject material, provides that touch of Oriental ingenuity and imaginativeness that distinguishes the work of the Japanese.

No less characteristic is the exact nicety of the placing not only of the various elements of the material, but also in relation to each other and the boundaries of the picture space. The picture, as it stands, seems so precisely finished and complete that to suggest any adjustment would be superfluous and impracticable; yet, while its cleverness is fully recognised, its pictorial motive, being almost entirely dependent upon design and more or less abstract in type, is somewhat slight, and, to western ideals, inclined to seem lacking in emotional appeal. It has a beauty, it is true, but it is one that appeals to the intellect rather than that sense of the really beautiful that we feel should be the inspiration or motive of a picture, and without which we are not fully satisfied.

We are inclined, perhaps, to regard the intention of this work, in so far as it relies upon pattern or decorative design, as an exaltation of arrangement into a sphere which is beyond its proper scope, it being our feeling that its function, in brief, should be limited to the means whereby a higher motive—a manifestation of some form of beauty or other—is expressed.

But we cannot deny, or fail to appreciate, that, to eastern minds, arrangement is an end in itself, and that they have every right to their ideals just as we have to ours. Viewed from this standpoint, the work is original and distinctive, and does what it sets out to do in a decidedly individualistic way. "MENTOR."

a considerable influence in creating a suggestion of pattern. In point of fact, it is the prime element of the design, and, though the interest centres in the shadow beyond question, the latter does, at the same time, form part of the embellishment of the circular formation, just as do the floral sprays.

It forms an irregular note in a regular formation. It prevents the repetition of the ribs and circles—a feature that also heightens the sense

HIGASA.

# PICTURES by Novices

## SOME CRITICAL COMMENTS on the Beginners' prints reproduced on the opposite page

UNLESS and until the beginner has had some little experience of enlarging, he finds it difficult to appreciate how much better a picture may be when cut down to its bare essentials than when it represents the whole of what is contained in the negative. Trimming always seems to involve something of a sacrifice, and, in the usual run of things, it is not until he finds that it is possible to fill the whole of a piece of printing paper from a portion only of the negative that he begins to understand its supreme importance in picture-making.

### **Pictures by Enlargement.**

No. 2 of the prints reproduced on the opposite page—"Barrowman's Yard," by B. E. Woods—is a case in point. The subject is very well seen; the figures are by no means badly caught; and the feeling of sunlight, as the pictorial motive, is nicely rendered and perfectly adequate.

The figures seem diminutive, however, and the sunlit area is comparatively small in relation to the somewhat uninteresting mass of surrounding shadow tone. The latter is obviously in excess, and, with the removal of a good quarter inch all round, the proportions of light and shade become better adjusted and the scale of the figures more significant.

To the worker of some experience—to whom the picture is the thing—the suggested trim is a necessity, and the wastage of the negative—if it can be so considered—is beside the point. It counts for nothing beside the fact that the picture is better without it; but, to the average beginner, the feeling of waste outweighs pictorial considerations altogether.

### **Subject and Selection.**

When he starts enlarging and sees the negative projected on the easel, and still more when he gathers that there is little wastage of printing paper, the value of including essentials only becomes apparent, and, in time, he, too, reaches the stage of placing the picture above material.

Moreover, because it is seldom possible to determine precisely how much should be included and how much left out at the time of exposure, it will become the general practice to

allow a margin over and above what is likely to be required, by means of which it will not only be possible to permit of subsequent adjustment at leisure, but the habit of trimming to suit the needs of the picture will also be acquired.

No. 1, "Windy Hill," by R. B. Harvey, is a subject in which there are two prominent objects—the mill and the group of trees. Neither can be said to exert a greater attraction than the other, and the attention is divided between them.

In the interests of compositional unity, one should be definitely supreme; but the trees, while possessing the greater mass, are placed too near the edge to assume any real strength of position, and the mill, while having the advantage of placing, has not scale enough to overcome the greater weight of the trees. If it were possible to add a little more on the right-hand side to bring the mill more into the picture, its strength would be greater, and if, at the same time, a quarter-inch trim were made from the left, the balance would swing over in favour of the mill, and the division of interest would be avoided.

### **Margin and Stance.**

As far as can be seen, however, there is no margin on the right, and it is not feasible to make the required addition on that side. That being the case, the only way of making a satisfactory composition is by trimming so as to exclude the trees altogether, which, of course, severely limits the pictorial attraction.

Had the viewpoint been more distant, the needful margin would have been provided. It would then have been possible for the arrangement to have been amended as suggested and in accordance with the requirements of the subject. Besides this, the disparity in scale between the trees and mill would have been reduced, and the difficulty of adjusting their relative attractions would be lessened.

"Landscape" (7), by E. G. Roughton, is one of those rare examples where the subject, just as it stands, does not need any alteration or adjustment to improve the composition. In its class it is an excellent bit of work, and the cloud formation of the sky combined with the landscape in sunshine

and shadow make an attractive and harmonious ensemble.

### **Technique and the Print.**

Its shape, which is rather more square than usual, seems to indicate that a measure of trimming has already been adopted, and, if so, the wisdom of allowing a margin is again demonstrated.

From the technical standpoint, too, it is a sound piece of work, and so is No. 8, "Lumbering," by C. H. Freese. The latter, however, would derive a certain measure of concentration if the suggestion of competition created by the inclusion of the strip of sky at the top were removed, and a more distant viewpoint would enable the figures and cart to be shown in better proportion.

When a group of this length is taken from the rear and the stance is so close, the nearer parts seem disproportionately exaggerated, and, had it been practicable, it would have been wiser to have stayed farther back.

As far as the line of sight is concerned, it could not have been better chosen, for the subject is seen at a good angle, and it is only because the cart is given an excessive importance that the more distant viewpoint would have been preferable. It would also have the advantage of permitting a slight addition on the left, which, in view of the presence of the figure, would be advisable.

### **Unusual Viewpoint.**

The downward direction of the line of sight is justified, in this instance, by the fact that the main interest lies in the foreground, but, as a rule, there is no virtue in any departure from the normal unless there is a sound reason for it.

Had the tree tops in No. 6, "High in the Air," by F. Mackel, been of a more attractive form, and had there been a cloud effect of striking formation, the upward viewpoint might have been commended, but, in the existing circumstances, neither of these excuses is available and the departure from the normal is scarcely warranted. That the normal point of view is preferable is well shown, not only by those examples already discussed, but also by Nos. 3, 4 and 5, all of which have their points, and do not rely upon eccentric methods of approach.

"MENTOR."

# With the Beginners

## NOTES AND NOTIONS FOR THE LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

### MAKING SLIDES FROM $3\frac{1}{4} \times 2\frac{1}{4}$ NEGATIVES.

IT is surprising that more photographers, even beginners, do not make lantern slides. The very best result most negatives will give is not on any kind of paper, however good it may be, but in the form of a transparency. This is particularly the case when the effect depends on light. The light is direct in the slide; it is only reflected in the print; and this makes all the difference.

I am aware of the objection that slides cannot be shown and carried about as easily as prints. But do photographers cart their best prints about? As to showing the slides there is very little in the argument. Those who belong to a photographic society can find opportunities for having their slides put through the lantern; and when they find that the results are satisfactory they may make a set of slides and show them to the members of their own and other clubs. A lantern show at home is more easily arranged than a ciné show.

Above all, do not forget that slides can be examined in the hand. The only requisites are a good light—daylight or artificial—and a piece of ground glass to hold a little way behind the slide. No print that you can produce from your pocket, or elsewhere, can compare with a slide.

Of course, I am thinking all the time of really good slides. A bad slide is possibly worse than a bad print. But it is easy to learn to make fine slides.

The first necessity—not quite so simple—is some good negatives. They must be good technically—clean, flawless, sharp, and with the right range of tones to do justice to the subject. They must also be good pictorially. Dull, hackneyed, badly-arranged subjects can be made into slides, but the slides will not win prizes.

A beginner who has some  $3\frac{1}{4} \times 2\frac{1}{4}$  negatives that fulfil these conditions, and who has never yet made a slide, might get a prize-winner out of his first box of plates. There is

time to set to work and enter some slides for "The A.P." Annual Competition, which closes on October 31st.

A necessary preliminary is to make suitable arrangements for making the exposures, as an ordinary printing frame is not the most convenient thing for the purpose. It will answer at a pinch, but there will be drawbacks.

I will assume, pretty safely, that the negatives are on film. In last week's issue, under the head of "Readers' Problems," a special frame for printing lantern slides was illustrated and described. It was mentioned that others are available, and some time ago I showed a simple form in one of these lessons.

An important point is to have the film held properly, so that the lantern plate can be laid on it and pressed into perfect contact. There are two serious objections to laying down the film on a plain piece of glass: the film will shift about; and the edges of the picture may be fogged. The parts of the plate that have had only clear glass over them will develop very quickly, and the edges of the dense strips will "creep" into the picture and spoil it. This is most likely to occur with development for warm tones on slow plates, but, anyhow, the risk should be avoided.

Fig. 1 is a diagram to scale of the accessory I use. It is a cleaned half-plate negative. On one side are stuck three strips of black paper. On the other side is another strip, shown shaded, stuck down by one edge only. The

four strips enclose a rectangle a trifle smaller each way than the actual picture-space on the negative.

A little of one or other of the short sides of the negative must necessarily be wasted; and whichever one it may be is slipped under the free edge of the wide strip, and the negative is adjusted so that when held up to the light the clear edges are completely masked all round. The only light that can reach the lantern plate is what passes through the actual negative image. This gives the sort of result shown in Fig. 2. There is no fogging, and masking is facilitated.

It may be asked why we should not slip the negative under a cut-out mask on one side of the glass, as in making prints. This is all right for prints, but the definition would suffer on a lantern plate which may be projected on a very large scale. With the device mentioned, the plate just misses the edge of the strip holding the negative, so that nothing whatever is interposed between plate and film.

Exposure may be made to the same light as is used for printing gaslight or bromide papers, but the distance may have to be increased to avoid having exposure times inconveniently short. Whatever the distance may be it should be adhered to exactly.

I would advise the beginner to start with a brand of plates for "black tone" slides, and to aim at a clean, pure black image. He can pass on to warm tones later.

I would also advise him to begin with Rytol tabloids as a developer. The solution will give beautiful blacks

and greys, and has no tendency to fogging. It will give warm tones as well, with suitable plates and modification. If, later on, the beginner finds a better all-round developer for lantern slides he should adopt it.

According to the instructions a pair of tabloids is dropped into  $2\frac{1}{2}$  oz. of water, crushed, and stirred up till dissolved. I prefer to take 5 oz. of water, and with this amount I have just developed a dozen black-tone slides. Development is slower, but it is quite fast enough for me.

Of course the exposure for any given negative must be judged pretty accurately, and then the only thing is to know how long to continue development. Shadows appear first, followed steadily by lighter and lighter tones. After a time, as the surface of the plate is examined by red light, it will be seen that the only parts of the emulsion remaining white are the unexposed margins, and the highest lights of the subject. A little later these high-lights become grey compared with the margins. Then stop. Rinse the plate, and fix in acid hypo.

When the plate is thoroughly fixed, examine it against a good light, with a piece of ground glass interposed. The slight veil of the high-lights has vanished. If the shadows are too dense, and lacking in transparency, try again with a rather longer exposure. If the slide is flat and weak, and not of a good colour, try again with a shorter exposure. If your second slide is not perfect in every way, make a third. You cannot help getting the right result, and then you can go ahead till you get a good slide practically every time.

W. L. F. W.

## DEVELOPING MINIATURE FILMS

By  
MERLYN SEVERN.

THE general adoption of the "daylight" tanks for developing "miniature" films has greatly simplified the process for the amateur, for in most patterns the film can be developed, rinsed, fixed and washed in the security of its apron, avoiding the risks of mechanical injury inseparable from hand development.

But even tank development, simple as it is, requires certain precautions. A difficulty confronts the user of a 35-mm. camera in the length of the apron (nearly six feet) necessary to cover his film. Only a contortionist could fix the beginning of the film to the reel without allowing

the end of the apron to trail on the floor. Some stand upon a chair, an uncomfortable and even hazardous proceeding in pitch darkness. It is simpler, before beginning to load, to roll up about half the apron and slip an elastic band round it as shown in the illustration. When this point is reached in loading the film, the band is slipped off, and the apron now swings clear of the floor.

The next point to make sure of is that the developer shall act evenly on all parts of the film; there must be no blank spots due to airbells or dust, and no streaks due to uneven development. The film should always receive a preliminary soaking for about three minutes, and a small quantity (say one drop per ounce) of Turkey Red Oil added to this water will remove dust and airbells and ensure that the developer flows evenly when it is poured in.

There is no need to stress the necessity for using a fine-grain developer, keeping all solutions at the same temperature, agitating the tank during development, and rinsing thoroughly between development and fixing. For 90 per cent of the average amateur's work a fine-grain film such as Panatomic or Selo fine-grain panchromatic will prove amply fast; and, besides a far finer grain, will give better gradation and a truer rendering of colour-values.

A developer which will give very satisfactory results with these films is the "buffered borax" formula, recently given in the Correspondence columns of "The A.P." by "Medicus." The coarser-grained super-speed films should be developed with paraphenylene-diamine, which can now be bought in a non-poisonous non-staining preparation.

When the final washing is complete the film must be hung up to dry, and the surface water wiped off. For this job I have found nothing better than an Agfa cellulose sponge (obtainable at Boots). The sponge is slit down the middle with a knife, while dry, for about three-quarters of its length. It is then thoroughly soaked in water and squeezed out; the film is held with gentle pressure in the slit, and the sponge is slowly drawn down its length.

*A rubber band keeps the end of the long celluloid apron from touching the floor.*

# Picture Points

## for Beginners, by RICARDO

### Providing Greater Interest

**M**ANY a landscape subject which looks attractive enough to the eye to prompt an exposure, fails to hold the same interest when seen again in the print.

This can be attributed to many factors, but, more often than not, it is the failure of the photographer to include something that will provide and maintain the interest *inside* the picture.

The first sketch is typical of many landscapes by beginners. When it is compared with the second sketch, and the powerful influence created by the trees on the left in providing interest in the picture is appreciated, it will be argued by many that if the trees were not there in just that position to suit the rest of the landscape, how can they be included in the negative?

To include another subject from a different negative to improve the main picture is fully justified as creative work.

It must always be appreciated that nature does not group itself specially for pictorial work. If we examine the sec-

ond sketch again we can see how the inclusion of the trees from another negative, which can easily be overprinted into the landscape, provides the main point of interest and fully justifies such creative composition.

### Pyramid Construction

**T**HIS is a constructional device that is perhaps most commonly used for grouping such subject matter as demands stability.

Although the subject matter of the two illustrations here is still life, the triangle or pyramid construction can be applied to many other things that can be photographed. Again, although the group in each of these sketches shows only one triangle traced round it, any other picture may reveal shapes or groups that suggest two or even more triangles of different sizes and proportions placed in various positions throughout the picture space.

Like the diagonal device explained at the top of this page, the contour of the group must not conform too closely to a triangle, otherwise the arrangement will look too mechanical and lack that dash of spontaneity that contributes so much towards the appeal of a good picture.

The fundamental idea of the pyramid construction is that the base gives a solid foundation for the group, but in the sketch here, we can see that it may also be used with the apex at the bottom.

When this is done, however, there is a great danger of the arrangement looking precariously balanced on the bottom point, particularly if this just touches any line going across the picture.

There is no rule that the pyramid must stand on its base, but when it is desired to invert its position, then the subject matter must be arranged so that extra support is given on one or both sides to give it stability, as suggested here by the stalks.

### Diagonal Composition

**A**LTHOUGH one of the simplest of the fundamental structures for pictures, the diagonal principle can be one of the most effective.

As it can be used equally well with the simple theme as with the more involved compositions, the beginner is advised to experiment with this principle.

The two sketches illustrate this point quite clearly, and show how an otherwise unattractive picture can, by simply changing the view-point taken up by the camera to a few yards to the left, turn the same subject matter into an extremely interesting arrangement.

But, as with all other fundamentals in composition it must not be slavishly copied with mathematical accuracy. It should never divide the rectangle into two equal parts, and the diagonal line, whether it is the contour of figures or buildings, of still life or merely cast shadows, should never be perfectly straight. Neither should it go right to the opposite corners, but be "held" from going out of the picture by suitable items as is suggested in this instance, by the boy and the kite.

When the diagonal line is well defined, such as that of the kite string here, some variations are needed to relieve the monotony. The clouds have been included here for this purpose, and if they are covered up temporarily by the fingers their value in this respect will be appreciated.

It is subject to the predominating rule of such "structure" composition, that it should not draw attention to itself, but merely influence and strengthen the general scheme.

# A Landscape Worker looks at the Salon

In the following notes the landscape work exhibited at The London Salon of Photography is commented upon. The Exhibition remains open until October 12th, at the Galleries of the Royal Society of Painters in Water Colours, 5a, Pall Mall East, and our readers should endeavour to visit it while they have the opportunity.

OF pure landscapes there are not a great number at this year's London Salon of Photography. Those exhibited are, however, of a high standard of excellence. If we include street scenes and seascapes, both of which are in the province of the outdoor photographer, it can be said with truth that there is plenty to interest at the Salon besides figure studies, portraits, and the usual array of "whatnots."

In "Glancing Shadows" (No. 9), C. J. Symes has produced a print in which sunshine on the wall of a house is extremely well depicted. The figures are well placed. The diagonal lines of the composition, interesting in themselves, have considerable value in that they lead the eye towards the group of boys.

"Sunshine and Rain" (No. 13), by F. B. Williams, is a subject that many have seen, but few have ever portrayed it in this striking manner. This tall white chalk cliff (possibly Beachy Head), photographed from a low viewpoint, thus enhancing its height, produces a most pleasing curve. The juxtaposition of the lightest part of the sky and the darkest part of the sky and the black rocks is a commendable feature. Here is a print of which simplicity is the keynote.

F. J. Mortimer gives us some views of bigger craft this year, and two fine seascapes, but in "Stowing the Jib" (No. 17) he has produced a typical yachting picture and one that is most pleasing to view. The dark stern of the yacht provides a delightful upward curve. The eye, travelling up this curve, is at once arrested by the figure of the man trimming sail. The highest

light of the print, coming in close proximity to the figure, helps to rivet attention upon him. The curve of the sail, terminating at the same place, further strengthens the somewhat central position of the figure.

G. L. Hawkins again exhibits some fine tree pictures, and, whereas one can recognise them at a glance as coming from him, his sense of pattern and design is such that in no sense is there ever a sameness. "Copper Beech and Silver Birch" (No. 30) is undoubtedly the finest tree picture in the Salon, maybe of any Salon, and lovers of trees, in fact landscape workers as a whole, might find in this print the most satisfying exhibit of the 1935 Salon. The tree trunks, beautiful in themselves, form a delightful pattern. The arrangement of the clouds which form the background is excellent. It will be noted how the line of the clouds towards the top of the picture forms an effective foil, preventing interest running up the trees and out of the picture. The light patch of cloud behind the fine curving trunks at the base of the left of the two main trees is a masterly stroke.

"L'eau qui fume" (No. 34), by Leonard Misonne, is one of three by that well-known worker. This print shows Misonne quality at its best. The standing figure against the cottages provides a keynote in just the right place, and is nicely balanced by the high-light on the water diagonally opposite.

"Winding Valley" (No. 78), by H. A. Murch, is a fine mountain scene with a valley which, unlike many of similar subjects, provides a well-defined sense of design. The eye

travels up that winding valley to the interesting curve at the top to return always and rest upon that fine patch of sunshine in the nearer plain of the valley.

"Cloud Magic" (No. 173), by Will Till of S. Africa, is a fine open landscape. Most notable is the feeling of the clouds receding into the distance. Looking into the blue sky in the gap in the clouds one really does feel that one is looking into infinity, a most rare quality in a picture.

"The New Moon" (No. 290), by J. M. Whitehead, is a fine print in that worker's usual style. The distant lakes form a balancing feature to the heavy trees, and the finely reproduced sky completes a delightful print.

No landscape worker should overlook the work of J. B. Eaton of Australia. His four prints, typical of his work, are, with one exception, of the wide open landscape type so difficult to handle photographically. In the hands of many a competent photographer such subjects would be a complete failure. It is all the more interesting to examine such work when it is obviously successful.

Space does not permit mention of a considerable number of prints that will appeal to every outdoor camera worker. As well as the work of the exhibitors named, the prints by the following should be viewed with more than passing care (to mention the authors of outdoor work only): Alex. Keighley, J. H. Anderson, James McKissack, G. L. A. Blair, A. Lomax, Lionel Wood, J. St. Aubyn, E. Chambré Hardman, J. Ainger Hall, E. Broomer, H. Ranson, Kalman Szollosy and J. H. Ahern. J. B. C.

## WHY IS IT?

I HAD a friend.

Not very well off, with a wife and kiddie, a promising business and a flair for photography.

His camera was a second-hand reflex of uncertain pedigree, which he picked up for the proverbial song.

His dark-room was the dining-room, after the child was in bed and mother had been banished to the kitchen.

Pie dishes held his developer and fixer—to the great concern of his wife—and the dark-room wasn't dark while daylight lasted outside.

His enlarger—but no words of mine can describe his enlarger. It had to be seen to be believed.

Yet photography was his constant joy. Under such adverse conditions as I have described he turned out jolly good stuff and derived untold pleasure from his hobby.

In the last two years his business has gone ahead immensely, and he is now passing rich. He lives in a house which possesses many more rooms than the family warrants, and one of them, on the top floor, well away from interference, is the dark-room.

It would do you good to see that dark-room—or else turn you green with envy.

Think of every possible refinement you would like in the dark-room of your dreams—he's got it.

His enlarger—but no words of mine can describe his enlarger. Go to the catalogue of the finest manufacturers in the world, turn to their most expensive product—that's it.

Of course, he possesses the latest thing in cameras. He gave me the old reflex, with a remark to the effect that he couldn't understand anyone being bothered with such trash.

I haven't got that friend now, but I know that he hasn't produced one single thing worth looking at since he moved into his new house, and for the last three months he hasn't touched a camera.

Why is it?

D. HOWARD EDWARDS.

# Letters to the Editor

*The Editor is not responsible for the opinions of his correspondents.*

## APPARATUS FOR EXHIBITION PICTURES.

SIR,—About a year ago you published statistics of the apparatus used by contributors to the articles "How I make my Exhibition Prints." At that time the reflex reigned supreme, but you ventured to forecast that the miniature camera would have usurped its place by the end of another year. With this in mind I have compiled a further list taken from September, 1934, to September, 1935. In this, I have treated the  $2\frac{1}{2} \times 2\frac{1}{4}$  as roll film, not miniature, but give the number of each, i.e.,  $2\frac{1}{2} \times 2\frac{1}{4}$  and  $2\frac{1}{2} \times 3\frac{1}{4}$ .

Reflex, 20; Folding Plate, 12; Roll Film, 12 ( $2\frac{1}{2} \times 2\frac{1}{4}$ ), 4; Miniature, 3; Reflex and plate, 3; Reflex and roll film, 3.

Sizes.— $\frac{1}{4}$ -plate, 12;  $3\frac{1}{2} \times 2\frac{1}{2}$ , 12;  $3\frac{1}{2} \times 2\frac{1}{4}$ , 8;  $2\frac{1}{2} \times 2\frac{1}{4}$ , 4. Lenses.— $\frac{1}{4}$ -plate, 6 to  $8\frac{1}{2}$  in.;  $3\frac{1}{2} \times 2\frac{1}{2}$ ,  $4\frac{1}{2}$  to  $5\frac{1}{2}$  in.

Only six used telephoto lenses, usually 12 to 17 in. on  $\frac{1}{4}$ -plate and 9 to 10 in. on  $3\frac{1}{2} \times 2\frac{1}{2}$ .

Printing processes.—Bromide, 23; Chloro-bromide, 14; Others, 3.

As I interpret the results, the reflex is still the most popular, but the number of  $3\frac{1}{2} \times 2\frac{1}{2}$  has increased, as also has the number of folding plate and roll film. Miniatures have increased by one only. In printing processes I have counted the use of bromide and chloro-bromide as one for each. On this, bromide is still the most popular, but there is a definite increase in the use of chloro-bromide. It can be seen, therefore, that your prophecy has gone somewhat astray, and although the miniature is highly and rightly popular, its use as a method of producing exhibition prints appears to be frowned on.

Trusting this may be of interest.—Yours, etc., C. ALLEN.

## THE "CORREX" TANK.

SIR,—I have read with considerable interest the letter of Mr. A. L. Spence in the September 4th, 1935, issue, page 239, concerning his problem with the "Correx" tank. My own experience with the tank in question indicates that one should have nothing but spotless, clean negatives, fully developed, free from air bubbles and free from variations in density when the tank is correctly used.

I am wondering whether Mr. Spence makes use of the little agitating knob which comes with the tank. Use of this knob is most essential. The majority of amateur enthusiasts either rock the film reel back and forth by hand or employ a mechanical agitator driven by a motor.

I do not know whether Mr. Spence develops Leica films or films of similar area and length, but as I have had experience with the tank constructed for the Leica camera and the tank for roll films, I feel that if Mr. Spence will adopt the procedure below he will experience no difficulty in securing proper negatives. The following procedure, however, should be followed religiously:

1.—After the film is loaded on the reel, be sure that the end clip (as Mr. Spence is already aware) is not pulled too taut.

2.—Fill the tank with clear water and soak the film for at least two minutes.

3.—Pour out the water and pour in the developer and agitate the reel through the entire time of development, either mechanically or by a motor-driven agitator.

4.—Upon completion of development, wash the film in running water for at least three minutes. The easiest way to do this is to secure a small length of hose that will fit in the hole of the Correx tank, and can be attached to the faucet.

5.—Pour out the rinse water and soak the film for at least five minutes in a hardening solution. We have several types in the United States, among which the hardener called "Claro" is particularly useful.

6.—After the reel has been in the hardening solution for about five minutes, rinse it briefly and then fill the tank with hypo. Agitate the reel until fixation is completed.

7.—Wash film thoroughly in running water for ten or fifteen minutes, and when washing is completed:

8.—Fill the tank with a solution of citric acid—one ounce of citric acid by weight to thirty-two ounces of water. Agitate film in this solution for about one minute—then hang it on the film clips and swab both sides gently with a Viscose sponge.

Fine grain is accentuated by quick drying. The writer uses an electric heater with a small fan which will dry a strip of Leica film in fifteen minutes, taking care that the room is reasonably dust-free.

May I say to Mr. Spence that if he will follow the foregoing procedure, keeping his temperatures within 60 to 66 degrees Fahrenheit, he will be absolutely amazed at the improvement in negatives.

Following the foregoing routine, and using a new fine-grain developer on sale in the United States, known as "S-10," the writer is enabled to secure needle-sharp  $16 \times 20$  in. prints from Leica negatives; and when I say "needle sharp" I mean it in all that the two words imply. In fact, this same procedure enables one to obtain prints from Leica negatives of very good detail, 40 in. in width, using, of course, a fine-grain film to start with. Mostly I use Eastman Panatomic film, which, with the S-10 fine-grain developer, produces negatives of pleasing softness for enlarging purposes.

If Mr. Spence will adhere to the above procedure, he will have no more blotchy films, and if he is using an enlarger he will be swept off his feet when he views the detail of the image projected up to a width, let us say, of 30 in.—Yours, etc.,

E. E. BUCHER.

33, Prescott Avenue, Montclair, N.J., U.S.A.

SIR,—Replying to Mr. A. L. Spence, the only help he needs is that contained in the instructions, and if he follows these carefully he will have no further troubles. I use this tank, have never had any trouble, and find it very easy to keep clean. I have no connection with the makers.—Yours, etc.,

N. MEYER.

## TROUBLE WITH ROLL-HOLDER.

SIR,—Referring to your correspondent's letter, signed "S. G. J.," in which he describes trouble experienced with a roll-holder, I beg to submit the following observations.

The fact that defective focus occurs either in the centre of the negative or at the edges only, and not uniformly over the whole, seems to indicate that the trouble is due to the bellows being almost air-tight, the film being sucked into a bulge each time the camera is extended for use.

As a simple remedy I suggest that S. G. J. extends the camera before winding the film into position No. 1 for his first exposure, and that after finally winding and making this exposure the film be left in position No. 1 until the camera has been extended for use a second time, the last operation before pressing the bulb being to wind on the film to position No. 2, and so on.

If this precaution gives improved results, steps might be taken to ventilate the bellows.—Yours, etc.,

I. DOUGLAS BARROW.

SIR,—"Trouble with Roll-holder." It sounds as though the film does not always lie flat, thus causing edges or centre of picture to be out of focus.

I suggest that S. G. J. examines the margins of his negatives where any evidence of want of flatness should be apparent.—Yours, etc.,

H. R. KERSHAW.

SIR,—With reference to the enquiry from S. G. J. re the above in your issue of September 4th. The trouble is either caused by the shutter or part of it having worked loose, or more probably the tail-board has sagged slightly, thereby causing the lens to be out of the parallel with the film. Until I discovered the latter fault I wasted a considerable number of exposures and time on needless repairs.—Yours, etc.,

ROLFE MITCHELL.

# Amateur Cinematography

## Use and Abuse of the Angle Shot By SIGURD MOIR.

The angle shot can be one of the most effective in the whole of cinematography. It can also be one of the most exasperating. The following article sets a clear line which may safely be adopted by the serious cinematographer.

A WELL-KNOWN "movie" critic once accompanied me to a film society performance in which a supposedly "arty" production of the modern school had been included. Angles there were *in excelsis* (though also *ad nauseam*) and I was hardly surprised when he leaned across and whispered: "These films give me a crick in the neck!"

Now, newspaper criticism does not greatly concern itself with how a film has been made—"fan" psychology and similar trifles presenting much easier ground, yet my friend realised that there was something wrong with the technical work on this particular film. There was. For many of the angles employed showed an entire disregard for the requirements of perfect "drawing."

When I use this word, I use it in the sense that graphic artists will appreciate. Where horizontal lines predominate, there should be a faultless horizontal as the base of the picture—and from this the receding parallels should converge to form a pleasing perspective. Alternatively, where the uprights have to be stressed, a strong vertical should form the keystone. Any departure from this simple rule is certain to annoy the spectators, for—like my friend—they will experience a desire to turn their heads first this way and then that in an effort to correct the false lines of the picture.

### Notes on Shooting.

Obviously, gross faults of this kind in any film mean that the cameraman does not know how to use his instrument. It is not "art" or even workmanship to adjust the camera in any position without thought or due consideration. Bearing in mind the rule we have just been discussing, it is apparent that the one essential in all shooting with the stationary camera is for a level base-line.

To illustrate this point, we cannot do better than consider the Ciné-Kodak Model K or any flat-bottomed camera. Let us place it on the edge of a bench or table. Now, by tilting the camera lever-fashion so that the bottom front edge rests perfectly level upon the table, we can obtain a fair number of legitimate angles. Similarly, by using the bottom rear edge as a fulcrum we can obtain many further angles of a different though still valid type.

The camera may now be levelled upon a ciné-tripod and the same move-

ments gone through—when it will be observed that all these angles are comprised in a single vertical swing of the camera. Hence, without disturbing the level of the camera, it is possible to bring the panoramic movement into operation—the result being that a wide variety of new angles is rendered immediately possible. Any or all of these angles may be used without fear of disturbing audiences.

### Importance of Editing.

Even where they are intelligently shot, "extreme" angles can easily bewilder or mystify an audience. In the Reunion film, "Breakers Ahead," for example, there is more than a marked tendency in this direction—and doubtlessly the same tendency would prevail in other films were they to include a similar number of such shots.

But it is the editing rather than the avoidance of angle shots that governs the clarity of any film, and of this we have a striking example in the amateur

production "Fight" (Burke and Bodington) shortly to receive its *première* in London. On the second reel of this film, an episode of cutting culminates in an extreme angle shot of youth in despair—a shot which, but for the considered assembly of supporting images, would have been almost unrecognisable.

The episode opens with a "straight" shot of the boy seated on one of the "stairs" of London river. This is followed by moderate angle shots of the overtone images, then by the first violent angle of the boy himself and, finally, by the extreme shot upon which the directors relied to create their atmosphere of hopeless despair.

This technique can, of course, be adopted by other amateurs, the important point being to ensure that the subject has been familiarised to the audience before the extreme-angle shot is worked into the film. Apart from this, it is stupid to use angles just because they are angles—whilst the laboured use of the device is even riskier still.

Effective angle shots contribute materially to the excellence of a film. The illustration above is from the author's "River Trip"—latest complete production of the Co-operative Film Group.

# How to Make a CINEMA SCREEN for Home or Schoolroom use

By "ACTINOGRAPHIST."

- 1.—Construct a rectangular framework, 4 ft. wide and 3 ft. deep, from 2 in. by 1 in. smooth battens.
- 2.—Tack on a single sheet of sanded three-ply wood. First-quality sheets with knotless surface only should be used.
- 3.—Sponge surface with methylated spirit.
- 4.—Immediately make an application of aluminium enamel. This should be evenly put on and the whole surface covered as quickly as possible.
- 5.—Leave in a dustproof room to dry.
- 6.—Obtain a roll of 2-in. black insulating tape and attach adhesive side to the face of the screen so that a marginal surround is formed.
- 7.—Finish the screen by fixing screw-eyes or extended picture-hooks into the upper long battens.

Where exceptionally brilliant effects are required, it is advisable to give the plywood surface a preliminary treatment with white undercoating—made by admixing white lead, zinc oxide, patent driers and turpentine in decorator's proportions; the same, of course, applies where the projector illuminant is not as powerful as it might be.

A soiled screen is not improved by washing, though it may be rubbed with Sorbo sponge and re-surfaced with aluminium "dope."

**IMPORTANT.**—Guests should be arranged as nearly as possible in the centre of the room before the screen, the high efficiency of its surface being less in evidence when the pictures are viewed from a wide angle.

## Subject for a Story Film

By  
M. A. LOVELL-BURGESS.

SO far as I know there has been no amateur ciné story film concerning London's river, and even the professional people seem to have overlooked a subject which is under their very nose. Yet here, at the door of countless London amateur ciné clubs, and only a few miles from ciné clubs of the Home Counties, is this fascinating other-world of warehouses and docks, barges and liners.

Recently members of the Finchley Amateur Ciné Society made an interest film of the Thames Docks, and the result is a film that really interests, supplemented as it is by the Port of London Authority film of the docks.

It is, however, not the docks, but London's river which I am putting forward as a worth-while theme for a film; and not for an interest film but for a story film which could be historical or romantic, adventurous, or an epic of commerce. Entrance to the docks is normally limited to parties, by arrangement, but any individual worker can take a steamer trip down the river from

Westminster Pier or Tower Bridge. I advise a few amateur ciné people to go down from the Upper Pool, preferably without their cameras, and to use their imagination as a jumping-off point for a story film.

Who lives in those tall, grey warehouses by the water side? What sort of life goes on by Wapping Stairs? What sort of people live on the tugs and the barges? On your left, as you go down the river, you will see the headquarters of the river police, with fast motor launches lying idle outside. That group of rather clumsy looking Dutch eel boats takes you back to the sixteenth century when the Dutch were granted perpetual right to anchor there for the help they gave during the Great Plague. On your right is a German ship flying Hitler's Swastika, which, in London's Pool, seems to take on a faintly piratical air. A little farther on is a brightly-painted Russian ship, just in from the Baltic, and behind her a ship has her funnel painted with the flag of Spain.

It is high tide and the river is full of craft; barges with terra-cotta red sails, laden with timber; drifters, dredgers, lighters and Dutch passenger-boats on their way to Rotterdam. And so on down the river, as I went last week, past the reclaimed marshes of Dagenham, to where the Thames broadens to the sea.

Would it be difficult to capture something of the river's glamour in a story film? Remember how Priestley, in "Angel Pavement," used London's river for prologue and epilogue?

The professional film people, as you may have seen in your newspapers, are at last making a story film in which the Thames is the principal actor. Arnold Ridley, the playwright, and George Cooper have written the script, and a cargo of film actors are on the river.

I don't know anything about the story they are filming, but I know there is plenty of scope for the amateur to step in and, with no great expense, capture romance and glamour.

# Hints for Lanternists

By R. M. FANSTONE.

THE operator at the lantern can contribute in no small measure to the success of a lecture. True, he is in the background, but his work, if well done, puts the lecturer at his ease, and by inspiring confidence, the speaker is able to devote the whole of his attention to his subject. Lanternists are good, bad or indifferent.

The difference between the first and the third class of operator is largely a matter of attention to details, which are overlooked, possibly because they appear so obvious.

It is not intended in this note to deal with the operating of a lantern, or the management of the lighting system, but rather to indicate some points where operators can be at fault in their methods.

The operator should be ready in good time. The lantern should be in position, the light adjusted, and the sheet arranged before the audience arrives. The important operation of adjustment of the light and focussing should be done in the dark, not in the semi-darkness that is all that is permissible while the audience is arriving.

Apparatus arranged under such conditions results in projected pictures which fall short in quality, which is not fair to the lecturer.

The difference between a brilliant picture and one less brilliant, is often

a matter of a fraction of an inch in the position of the illuminant.

It should be realised that the lecturer has gone to some trouble in the preparation of his slides, and the operator should see to it that they are shown in as perfect a manner as possible.

It is always a good plan to keep the boxes of slides in a slightly warm place until a few minutes before the lecture is due to begin, as this prevents the possibility of the slides becoming steamed and misty as soon as they are placed in the hot projector. This is particularly advisable if the slides have previously been stored in a cold place.

Great care should be taken in the adjustment of the light. This is one of the points which distinguish a good operator from an inefficient or second-rate one.

The lantern, or to give it its more modern name coined from the cinema, the projector, should be so arranged that with a slide having a three-inch mask, the picture will just cover the sheet, with a margin of about a foot all round to spare.

Sometimes the picture is too small upon the sheet, or too large, this latter being always a very bad fault. When arranging the apparatus the operator should see that the picture fills the sheet in the way mentioned,

using a slide which has the picture occupying the full space.

If the projector has to be tilted upwards it is advisable to see that the sheet is tilted downwards to be at right angles to the beam, as this prevents distorted verticals.

Lecturers differ in the way in which they indicate that the slide must be changed. The old-fashioned clicker is as good as any method of sound, but a better signal is a small red lamp, which is fixed, together with the battery, alongside the projector in such a way that the lanternist alone sees the signal; operated with a pear-shaped switch held by the lecturer.

There are still some lecturers who rely upon a tap upon the floor with a pointer, and in this case the operator has to be on his guard against similar sounds which may be made by a movement amongst the audience. The next slide should always be in position, and the operator should make immediate response to the lecturer's signal to change.

The lanternist must always be prepared for emergencies, and a small torch-lamp kept handy, together with a spare projector lamp, will save much time and worry when anything goes wrong at his end.

If attention is paid to all these small points, a successful evening is ensured for all.

## THE WEEK'S MEETINGS

### Wednesday, October 2nd.

Blackburn and D.C.C. "Making the Exhibition Print." Criticism of Members' Prints. S. Bridgen.  
Croydon C.C. "Amateur Portraiture." Robert Chalmers.  
Northallerton and D.P. and C.S. Ciné Evening—Members' Films.  
Partick C.C. Opening Night.  
Rochdale P.S. Annual General Meeting.

### Thursday, October 3rd.

Armley and Wortley P.S. "Keeps for Remembrance." Henry Crowther.  
Ashton-under-Lyne P.S. "Chloro-Bromide." S. Bridgen.  
Bury P.S. "Composition." F. Holmes.  
Cardiff C.C. "Ciné-Snaps." P. C. Seddicombe.  
Derby R.I.P.S. "The Elements of Pictorial Composition." J. A. Foulkes.  
Hammersmith H.H.P.S. "Bromoil." L. G. Gabriel.  
N. Middlesex P.S. Competitions, Prints: Special.  
Richmond C.C. "The President's Evening." W. Sanderson.  
Wimbledon C.C. Members Welcomed by The President.  
Woolwich P.S. Lecturettes. Chelsea P.S. Members' One-man Show. R. J. Dunn.

### Friday, October 4th.

Harrogate P.S. "Upper Egypt and the Tutankhamen Treasures." J. E. A. Tittle.  
King's Heath and D.P.S. Print Criticism—Architecture.  
Leigh L.S.P.S. Social Evening.  
Leytonstone and Wanstead C.C. "A Plea for the Faker." C. Wormald.  
Royal P.S. "Cannibals and Dragonland." Arthur Pereira.

### Saturday, October 5th.

Blackburn and D.C.C. I.C.P.A. Prints and Slides for a Fortnight.  
Hammersmith H.H.P.S. "Intensification and Reduction." C. E. Homer.

### Sunday, October 6th.

Ilford P.S. Hainault and Lambourne End.

*Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.*

### Monday, October 7th.

C. London and Cripplegate P.S. Projection of Films taken on Tug-Boat Outing.  
H. E. Isard.  
Luton and D.C.C. Annual General Meeting.  
Oldham E.P.S. Slide Tinting and Technical Competitions.  
S. London P.S. Monthly Competition. Criticism of Prints and Slides.

### Tuesday, October 8th.

Birmingham P.S. "Wonderland of the Western World." J. Dudley Johnston.  
Halifax P.S. "Picture-Making with the Camera in the Field." H. Baintow.  
Harrow C.C. R.C.A. Home Talkie Demonstration.  
Leamington and D.P.S. "A Warwickshire Medley." Lewis Lloyd.  
Leeds P.S. "A New Venture in Spain and Morocco." John Armitage.  
Royal P.S. "The Glories of the Peak District." R. C. Rutherford.  
Rugby and D.P.S. "The Science and Art of Photography." (Structure of Art.)  
St. Bride P.S. Lantern Lecture. J. Lemon.  
Sheffield P.S. "Retouching." C. Russell Crimp.  
Small Heath P.S. Lecturettes.  
Stafford P.S. Whist Drive at Deltas' Bridge Café. 7.45 p.m.  
Streatham and D.P.S. "Press Button B."—Photographic Variety Show. G. H. Dammatt.  
York P.S. Lantern Lecture. Y.P.U. Shield Slides.

### Wednesday, October 9th.

Birkenhead P.A. "Cameras." J. H. Trace.  
Birmingham P.S. (Ciné). "Tinting." (Cinecraft Supplies.)  
Brighton and Hove C.C. Annual General Meeting.  
Croydon C.C. "Vesuvius, Pompeii and Herculaneum." E. A. Robins.  
Dennistoun A.P.A. Opening Winter Syllabus. C. Graham.  
Northallerton and D.P. and C.S. "Picture Gleanings in Many Lands." Alex. Keighley.  
S. Suburban and Catford P.S. "Laugh, Learn, Laugh." C. Roberts.  
Stockport P.S. Annual Meeting.  
Worcestershire C.C. "Old-Time Agriculture and Country Life." J. C. Morgan.

# Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a separate stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

## Spotting Glazed Prints.

Can you tell me an efficient method of spotting glossy prints for Press reproduction?

K. A. W. (Saltdean.)

The best thing to do in spotting glossy prints is to use a water-colour pigment to which a little gum has been added.

## Chromium Intensification.

What is the cause of the orange colour in the enclosed film? It has been intensified by the chromium method.

R. D. F. (Watford.)

The bichromate in the chromium intensification process stains the print heavily, and this stain must be removed by prolonged soaking and washing before redevelopment is started. The image itself remains a yellow colour, but, of course, turns black in the developer, and there should then be no trace of yellow in the negative at all.

## Colour Filters.

When using a colour filter must one use a tripod in order that the necessarily increased exposures be given without camera shake. When is a colour filter advisable for landscapes, etc.?

B. J. (Catford.)

With good subjects and an open light it is quite possible to give hand exposures with a light colour filter on the lens. This may be so light that it does no more than merely double the exposure. You will not obtain any noticeable advantage with such a filter unless there are blues in the sky or elsewhere, which would probably come out too light in the print unless a filter were used.

## Elon.

What is Elon and where can I get it to make up a developing formula? F. S. K. (London.)

Elon is the name given by Kodak, Ltd. to their brand of metol, and is supplied by them at any of their branches. Thus, whenever metol appears in a formula, it can be substituted, if necessary, by the same quantity of Elon.

## Convertible Lenses.

What is the difference between a symmetrical and an unsymmetrical lens.

D. M. C. (Clapham Common.)

These two terms are usually given to lenses of the "Convertible" or "Combination" type, of which the front or back component can be used alone for the purpose of producing a larger image on the negative than would be obtained by using the lens complete. When this type of lens is called symmetrical it means that both the front and back components have the same focal length. When the focal lengths of these two components are not the same then the complete lens is said to be unsymmetrical.

## Focussing Scale.

Can one work out a focussing scale for a camera by mathematics for a lens whose focal length is known?

D. M. B. (Finsbury.)

Yes, it can be done by mathematics, but we would suggest that as the ground-glass focussing screen must first be used for finding the infinity mark, it is quicker and more simple to continue by focussing by the ground glass on different distances and marking the corresponding measurements on the scale.

## Factorial System.

What is meant by the "factorial" system of developing plates and bromide papers?

J. D. (Southend.)

Briefly, it means that if the time taken for the first trace of an image to show after the developer is applied, is multiplied by the "factorial" number of the developer used, the product will be the total time necessary for the plate or paper to be completely developed. Different developers have different factors and in "The Dictionary of Photography" it will be seen that it can be as low as  $4\frac{1}{2}$  with hydroquinone, or as high as 40 with Rodinal.

## Enlargements.

What is meant by "lineal" and "diameters" as enlargement terms? C. D. F. (Glasgow.)

The term "lineal" means the length along a simple straight line, so that if a print were said to be six times "lineal" enlargement it would mean that the distance between two given points on the enlargement would be exactly six times larger than the distance between the same two points on the negative. The term "diameters," which is more commonly used, means the same thing. If we divide the diagonal of the negative portion to be enlarged into the diagonal of the enlargement, the quotient will be the number of diameters enlargement. This number of diameters enlargement is sometimes expressed as  $6\times$ , or 6 magnifications. This is opposed to the term of "area" enlargement, which should never be used as an indication of the degree of enlargement.

## Lens Hoods.

Which is the better type of lens hood, a complete tube or one which has one side partly cut away? D. O. (Swansea.)

Where the light is coming from one source and there are no reflections from other directions then, perhaps, the "cut away" hood is better than the complete tube. But when there are strong lights coming from all sources then a complete tube is better, but it must be lined inside with some non-reflective material, such as black velvet.

## Borax and M.Q. Developer.

Can you supply me with a formula using M.Q. with Borax for fine-grain development?

M. C. (Sheffield.)

A suitable M.Q. and Borax formula is as follows:

Metol	..	..	..	4 grs.
Hydroquinone	..	..	..	10 grs.
Sodium sulphite (anhy.)	..	..	..	$\frac{1}{2}$ oz.
Borax	..	..	..	4 grs.
Hot water	..	..	..	5 oz.

## Pinholes in Bellows.

How can I fill up pinholes in my bellows?

T. T. (Rochdale.)

Mix a little rubber solution, such as is sold for repairing cycle tyres, with some powdered lamp-black. If this is worked into the inside of the fabric or leather when the bellows are fully extended, and allowed to dry, it will prove an effective remedy. When the pinholes are very large, then an additional support is required in the form of small pieces of black court plaster, particularly when the hole is in a corner of the bellows.

## Enlargers.

What advantage has a condenser enlarger over the condenserless pattern? J. D. (Dover.)

With the illumination and lens-aperture being equal in both patterns, the condenser enlarger is considerably faster, and tends to give a slightly stronger tone contrast in the print. On the other hand, it reveals all blemishes and retouching, as the condenser gives directional lighting, unlike the other pattern which gives diffused lighting, i.e., "scattered" light which softens down all blemishes.

# The Amateur Photographer and Cinematographer

## Annual Lantern-Slide Competition - 1935

**Closing Date:**  
**THURSDAY, OCTOBER 31st.**

### Classes and Subjects.

- CLASS I.**—Landscape, with or without figures, sea subjects and river scenery.
- CLASS II.**—Portraiture and figure studies, whether indoor or outdoor pictures.
- CLASS III.**—Architecture, interior and exterior.
- CLASS IV.**—Flowers, fruit and other "Still-Life" subjects.
- CLASS V.**—Natural History subjects.
- CLASS VI.**—Lantern slides in colour (not hand-coloured).
- CLASS VII.**—Champion Class. Open only to those who have won silver or bronze plaques in *The Amateur Photographer and Cinematographer* Lantern-Slide Competition.

### Conditions and Awards.

(1) All classes are open to amateur and professional photographers without any restrictions. All slides must measure  $3\frac{1}{2} \times 3\frac{1}{2}$  in., and must be properly spotted for showing in the lantern.

(2) One silver plaque, one bronze plaque, and four certificates are offered in each class except Class VII. In that, the Champion Class, the award will be a mounted and signed exhibition picture by Mr. F. J. Mortimer, the Editor of *The Amateur Photographer and Cinematographer* and *Photograms of the Year*.

(3) All slides which receive any award will become the property of *The Amateur Photographer and Cinematographer*, and will be sent round amongst the societies and such other associations as apply for the loan of them. Any other slides may be selected for circulation in this manner, and will be paid for at the rate of half a crown each.

(4) Competitors may send any number of slides in any class, and may be recorded as winning any number of awards; but no competitor will actually receive in the competition more than one silver plaque, one bronze plaque, and one certificate, on which all his awards will be recorded. Competitors may enter in any number of classes.

(5) Each slide must bear the competitor's name, its title and its class. With the slides must be sent an envelope containing the name and full address of the competitor, a list of the titles of all the slides he is sending in, and the class in which such are entered. Particulars as to make of plate, exposure, developer used, etc., and other technical data which may be of interest for incorporation in the notes which will accompany the winning slides on their tour among the photographic societies, should also be given where thought necessary.

(6) A stamped and addressed label (not loose stamps) should be sent with the slides for their return if unsuccessful; but in no circumstances can the Editor or the Publishers accept any responsibility for slides sent in for competition, nor for their return; neither can slides be returned which are not accompanied by stamps as above.

(7) Not more than one slide from any one negative can be admitted, nor may any slide compete which has before won an award in these competitions.

(8) The last day for receiving is Thursday, October 31st. The slides must be well packed, and addressed "Slide Competition, The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and all carriage charges must be prepaid.

(9) In any case of dispute, the competitor agrees to accept the decision of the Editor of *The Amateur Photographer and Cinematographer* as final.

# 80th ANNUAL EXHIBITION

**From Saturday, SEPT. 14th  
until Saturday, OCT. 12th  
at the Society's Galleries  
35, RUSSELL SQ., W.C.1**

The Exhibition will be open to the public daily (Sundays excepted) from 10 a.m. to 9 p.m. Tuesdays and Fridays, 10 a.m. to 6 p.m. Admission free.

## THE ROYAL PHOTOGRAPHIC SOCIETY

The Royal Photographic Society of Great Britain publishes annually, under the title of *THE YEAR'S PHOTOGRAPHY*, a selection of the outstanding photographs accepted for its Annual International Exhibition, which is held at its galleries at 35, Russell Square, London, W.C.1, in September and October. These photographs are selected from the Pictorial, Natural History and Record Sections of the Exhibition, and are reproduced in photogravure. They comprise a handsome permanent pictorial record of the Exhibition.

For the picture-lover *THE YEAR'S PHOTOGRAPHY* is a never-failing source of interest and pleasure; and for all interested in photography a valuable source of inspiration and instruction.

Each picture reproduced is a model of its kind and has passed through the fires of two selections, first from the thousands of the prints submitted to the Exhibition and secondly those actually accepted for it.

Accompanying the illustrations are critical appreciations by well-known authorities which greatly enhance the value of the collection of pictures.

The 1935-36 edition contains 70 reproductions, most of them whole-page. The critical appreciations are contributed by Robert Chalmers, F.R.P.S., President, Royal Photographic Society, Ralph Chislett, F.R.P.S., M.B.O.U., F.Z.S., E. P. Davey, B.Sc., Ph.D., A.R.P.S., and J. Dudley Johnston, Hon. F.R.P.S.

*THE YEAR'S PHOTOGRAPHY* is published at 2s. 6d. in paper covers, and 5s. cloth bound. The edition is strictly limited and once exhausted is not reprinted.

Obtainable from the Publications Department  
**ROYAL PHOTOGRAPHIC SOCIETY, 35, RUSSELL SQ.,  
W.C.1**

# The AMATEUR'S EMPORIUM

## Business Notices Publishing

**OFFICES.**—Dorset House, Stamford Street, London, S.E.1. Telegrams: "Amaphot, Sedist, London." Telephone: Hop 3333 (50 lines).

**PUBLISHING DATE.**—"The Amateur Photographer and Cinematographer" is on sale throughout the United Kingdom every Wednesday morning.

**SUBSCRIPTION RATES.**—British Isles 17/4 per annum, Canada 17/4, other countries abroad 19/6 per annum, post free.

**REMITTANCES.**—Cheques, etc., should be crossed and made payable to Iliffe and Sons Ltd. "The Amateur Photographer" can be obtained abroad from the following: **UNITED STATES:** The International News Co., New York. **FRANCE:** W. H. Smith & Son, 248, Rue Rivoli, Paris; Hachette et Cie, Rue Reaumur, Paris. **BELGIUM:** W. H. Smith & Son, 71-75, Boulevard Adolphe Max, Brussels. **AUSTRALIA:** Gordon & Gotch, Ltd., Melbourne (Victoria), Sydney (N.S.W.), Brisbane (Queensland), Adelaide (S.A.), Perth (W.A.), and Launceston (Tasmania). **NEW ZEALAND:** Gordon & Gotch, Ltd., Wellington, Auckland, Christchurch and Dunedin. **INDIA:** A. H. Wheeler & Co., Bombay, Allahabad and Calcutta. **CANADA:** Imperial News Co., Toronto, Winnipeg and Vancouver; Benjamin News Co., Montreal; Gordon & Gotch, Ltd., Toronto. **SOUTH AFRICA:** Central News Agency, Ltd.

## Displayed Advertisements

Communications on Advertisement matters should be addressed: The Advertisement Manager, "The Amateur Photographer and Cinematographer," Dorset House, Stamford Street, London, S.E.1. Copy for displayed advertisements for the issue of any particular week must reach Dorset House by the first post on Tuesday morning in the week previous. Rates and conditions will be sent upon application.

## Prepaid Advertisements

**SALE AND EXCHANGE: AMATEURS ONLY—**

12 words or less..... 1/-

1d. for every additional word.

**PROFESSIONAL AND TRADE:—**

12 words or less..... 2/6

2d. for every additional word.

Each paragraph is charged separately.

**SERIES DISCOUNTS** are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid and posted to arrive at the Head Office, Dorset House, Stamford Street, S.E.1, not later than first post FRIDAY for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 260, Deansgate, Manchester, 3; 28a, Renfield Street, Glasgow, C.2.

## CAMERAS AND LENSES

**ROLLEIFLEX** 2½×2½, Zeiss Tessar f/4.5, Compur shutter, 1 to 1/300th, non-automatic, leather case, £7; condition perfect.—Maughan, Dunvegan, Hartford, Cheshire. [9464]

**3½×2½** T.P. Junior Special Reflex, f/4.5 Ross 5½-in. lens, also Dallmeyer f/6 Popular Telephoto 10-in. lens, 3 filters and holders, 6 single dark slides, F.P.A., focussing magnifiers, solid leather case; beautiful condition, £12/10.—Bankfield House, Chevin, Belper. [9479]

**STANDARD** Leica, Enlarger, tank, £12/15; S exchange considered, 3½×2½.—51, Stoney St., Burnley. [9531]

**ZEISS** Ica 9×12, Novar f/6.8, Dervall shutter, 1/100th, rising, cross front, 2 slides; good condition, £2.—Gartside, 234, Oldham Rd., Manchester, 10. [9590]

**£6/10** T.P. Reflex, 3½×2½, f/4.5 Ross Xpres, rev. back, R.F.A., F.P.A., 12 slides, filter and holder, magnifier, case; £4. Weeny Ultrix, f/4.5 anastig., D.A.; "Photograms of Year," 1930-35, 3/- each.—Morrin, Gateacre Grange, Liverpool. [9591]

**3½×2½** Salex Reflex, f/4.5, revolving back, 1/10th to 1/1,000th, 9 slides, F.P.A., roll-film adapter, sky filter, £5/10.—Below.

**V**EST Pocket Picolette, Zeiss f/4.5, D.V. finder, Compur, 1/300th, leather purse; fine condition, £3/15.—Painter, 33, Park Rd., Luton. [9511]

## WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

## CAMERAS AND LENSES

**B**ABY Ikonta, Novar f/6.3 lens, leather case, as new, £3.—Box 5446, c/o "The Amateur Photographer." [9596]

**B**EST Offer secures.—3½×2½ T.P. Reflex, in good order, Cooke f/3.5, magnifiers, F.P.A., 6 slides, canvas case.—Lambert, 7, Reigate Rd., Ewell, Surrey. [9598]

## CAMERAS AND LENSES

**SWAP.**—1935 Pilot Reflex, Tessar f/2.8, for Baby Rolleiflex, similar age and lens equipment; new Zeiss Range-finder, 25/-; Justophot and case, 15/-; Tall Ash Tripod, 5/-.—Short, 22, King St., Canterbury. [9592]

**G**ENUINE Bargain.—Zeiss Icarette 2½×4½, f/4.5 Tessar, D.A. Compur, leather case; cost £15; as new throughout, £7/10.—Cook, Jeweller, Newark. [9605]

**I-PLATE** Lancaster Instantograph, and tripod 2 and case complete; No. 6 Folding Pocket Kodak and tripod; three Print Frames and Dishes, Dark-room Lamp, etc.; good condition; offers.—Walder, Leigh Manor Farm, Cuckfield, Sussex. [9607]

**L**EICA IIIa, f/2 Summar, 1/1,000th, fortnight old, offer; Leica III, f/2 Summar, tripod, light meter, filter, month old, £30; duty paid.—Box 5495, c/o "The Amateur Photographer." [9608]

**ROLLEIFLEX** 6×6 Non-automatic, Zeiss f/4.5, in Compur to 1/250th, Zeiss filter, supplementary lenses; fine condition, £8/10.—Proprietor, Strathmore Hotel, Torquay. [9613]

**S**UPER Ikonta, 8 or 16 on 3½×2½, Tessar f/4.5, coupled range-finder, F.R. case, filter, lens hood, Bewi meter; cost over £20; perfect, £12; no offers.—Malcher, 35, Cursitor St., E.C.4. [9623]

**L**ATEST ½-pl. Ica Pressman Reflex, 6½-in. Zeiss Tessar f/4.5, 6 slides, F.P.A., case; lens cost £9/17; equal to new, £9; approval.—Cox, Brean Down, Somerset. [9635]

Advertisements are inserted, as far as possible, in the order received, and those received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

Postal Orders sent in payment for Advertisements should be made payable to **ILIFFE AND SONS LTD.**, and crossed

& Co.

Notes being untraceable if lost in transit, should not be sent as remittances.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

**BOX NUMBERS.**—For the convenience of advertisers, letters may be addressed to numbers at the office of this paper. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charges, which must include the words: "Box 000, c/o 'The Amateur Photographer'." Replies should be addressed: "Box 000, c/o 'The Amateur Photographer,' Dorset House, Stamford Street, London, S.E.1." and these letters will be simply forwarded by us to the advertiser. It must be understood that we do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisement. Readers who reply to Box No. advertisements are warned against sending remittances through the post except in registered envelopes. In all such cases the use of the "Deposit System" is recommended.

## Special Note

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post. When sending remittances direct to an advertiser, stamp for return should also be included for use in the event of the application proving unsuccessful.

## Deposit System

Readers who hesitate to send money to advertisers in these columns may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Amateur Photographer and Cinematographer," both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods, they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in the event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For all transactions up to £10 a deposit fee of 1/- is charged; on transactions over £10 and under £50 the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/8; and on all transactions over £100, one-half per cent. All deposit matters are dealt with at Dorset House, Stamford Street, London, S.E.1, and cheques and money orders should be made payable to Iliffe and Sons Ltd.

## CAMERAS AND LENSES

**EN**SIGN Special Reflex,  $2\frac{1}{2} \times 3\frac{1}{2}$ , Dallmeyer Press f/3.5, quick-wind focal-plane shutter, 1/15th to 1/1,000th, 15 D. slides, F.P.A. and R.F.A.; perfect condition, £10; bargain.—Pratt, Rose Grove, Beeston, Notts. [9614]

**Z**EISS Icarette  $3\frac{1}{2} \times 2\frac{1}{2}$  Roll Film, Plate Camera, Tessar f/4.5, double extension, D.A. Compur, 3 slides and case; in perfect condition, £10, or near offer; deposit system.—66, Nethergate, Dundee. [9616]

**45**  $\times 107$  Stereoscopic Goerz Tenax Camera, Goerz Dogmar f/4.5 lenses, 3 double dark slides, F.P.A., solid leather case; first-class condition, £7/10, or near offer.—Box 5496, c/o "The Amateur Photographer." [9617]

**M**ENTOR Folding Reflex, f/4.5 Voigtlander Heliar lens, 3 D.D. slides, F.P.A.; perfect condition, £6/17/6, or exchange.—Below.

**G**OEERZ Anschütz 3-pl. Press Camera, latest self-capping shutter, 5 to 1/1,000th sec., f/4.5 Dogmar lens, 5 D.D. slides, F.P.A. and leather case, £11, or exchange.—Below.

Model III, with 1/2 Summar lens... £39 10 0

### The "PILOT"

Roll-film Reflex

The smallest reflex camera on the market. Gives 16 exposures on V.P. size film, 3×4 cm. Simple lever movement to change the film; automatic exposure indicator.

With f/3.5 Zeiss Tessar lens in Compur shutter, speeds 1 to 1/300th sec. £18 15 0

With f/2.8 Zeiss Tessar lens in Rapid Compur shutter, 1 to 1/500th sec. £22 2 0

Leather Case... £1 0 0

### The New "BALDINA"

A new miniature camera, takes 36 pictures on 35-mm. daylight-loading spools. Automatic exposure counter, parallax correcting view-finder, Meyer f/2.9 Trioplan lens in Rapid Compur shutter, 1 to 1/500th sec. £11 10 0

With Meyer f/3.5 Trioplan lens in Compur shutter, 1 to 1/300th sec. £9 10 0

### THE ZEISS IKON "CONTAX"

The miniature camera with a metal incompressible focal-plane shutter, providing exposures up to a proved 1/1,000th sec. Long base distance meter coupled to and automatically focusing lenses. Choice of 12 Zeiss lenses, apertures f/1.5 to f/8. Die-cast body housing all working parts; open back, easy to clean and load in daylight. Takes any make of 24×36 mm film.

Price with Zeiss Tessar f/3.5... £31 0 0  
" " Zeiss Tessar f/2.8... £33 15 0  
" " Zeiss Sonnar f/2... £41 0 0  
" " Zeiss Sonnar f/1.5... £56 5 0

### THE ZEISS IKON "SUPER IKONTA"

The latest 1935 Zeiss Ikon camera, with Zeiss Ikon patent distance meter coupled to lens focussing. Shutter and film-winding mechanism coupled together, absolutely prevent inadvertent double exposures. Die-cast body of aluminium—exceptionally strong—hinged back, front self-erecting, shutter release situated conveniently on top of camera. Takes 11 pictures 2½×2½ on the usual 2½×3½ roll-film spool.

Price, with Zeiss Tessar f/3.5, in Rapid Compur shutter £25 5 0  
Price, with Zeiss Tessar f/2.8, in Rapid Compur shutter £28 5 0  
Complete list of Zeiss Ikon cameras post free.

## 16:1 ratio of replies

An interesting comparison of results from an advertiser in "The Amateur Photographer"

"I had no difficulty in disposing of the camera. I had 16 replies to my advertisement in 'The Amateur Photographer,' although I had only one reply to an advertisement in another journal offering the same camera at the same price."

From J. F. SMITH,  
Canterbury Road,  
FOLKESTONE

## THIRTEENTH EDITION

# WALL'S DICTIONARY of PHOTOGRAPHY

AND REFERENCE BOOK  
FOR THE AMATEUR  
AND PROFESSIONAL  
PHOTOGRAPHER

Edited and largely re-written by  
F. J. MORTIMER, Hon. F.R.P.S.

All the latest photographic principles are incorporated in the present edition, which includes up-to-date information on such recent developments as infra-red, high-speed and colour photography. The volume provides practical information in dictionary form on every phase of the subject—technical, pictorial, scientific and general, and is in itself an explanatory index to all terms, formulæ, etc. Its contents are made readily accessible by the extensive use of cross references.

**THE "Leudi" EXPOSURE METER**  
PRICE ONLY  
**5/-**

Purse Case, 1/- extra

Less than half the size of an ordinary pocket lighter!—the LEUDI is easily the smallest and neatest exposure meter made. As simple as it is small, and as efficient as it is simple it is the finest value in exposure meters that you can possibly obtain. It is as effective indoors as out of doors, and can be used with plates or films of any make.

Ask your dealer to show you a "Leudi."

The best  
Photo  
Corners!

## "TRANSPAROL"

are made of pure "Cellophane" (Reg. Trade Mark), and not cheap imitation material. They are invisible, and show the picture up to its extreme edges. 6d. per box of 100.

*They do not stick together and ruin the snaps like those of inferior makes.*

## "FAVORIT"

are handsome opaque corners, easily and quickly fixed in position. Very ingenious—they make snapshot albums very beautiful—and eliminate the bugbear of messy paste pot and brush. Made in Sepia, Grey and Black. 6d. per box of 100.

# HAND CAMERAS

By R. Child Bayley

THIRD EDITION

An outstanding feature of this book, which makes a special appeal to all amateur photographers, is a number of separately printed plates, all from hand camera negatives by the author. These are selected to show the very wide range of subjects accessible to the snapshotter, from pure landscape to telephotographic portraiture.

Though primarily written for the beginner, "Hand Cameras" contains much of interest to the advanced worker, and should be in the working library of all who would attain to the highest degree of artistic excellence in their work.

PRICE 3/- NET

By post 3/3

## "AKRISKOP" FOCUSSER FOR ENLARGING

The making of enlargements from miniature negatives with non-automatic vertical enlargers would be easy were it not for the difficulty of focussing the pictures critically sharp, but with the AKRISKOP, which is the first and only instrument for its purpose, those who have hitherto experienced difficulty in focussing can at once obtain enlargements of perfect sharpness.

## Every ENLARGER in stock at Bond Street

Ensign, V.N., Praxidos, Zeiss Ikon. They're all here—come and see them demonstrated.

## LEICA 'FOCOMAT'

Has automatic focussing and enables you to make perfect pictures up to any size from 3 1/2 x 2 1/2 to 15 x 10 in. Diffused illumination gives soft, harmonious enlargements. For use with your own Leica lens.

£16 : 6 : 6

Nine monthly payments of 38/2.

## ZODEL DE LUXE ENLARGER

Embodying the Zodel patent composing and masking carrier. Constructed of solid oak. Extra long extension. Raising, lowering, tilting, swing and revolving carrier adjustments by rack and pinion. Iron light chamber. Crystal plano convex condenser.

1-pl., without lens, from

£10 : 10 : 0

## ZODEL LENS HOOD

It is not only in the summer that the Zodel lens hood is indispensable. In autumn photography, with the sun at a lower altitude and giving many beautiful shadow patterns and against-the-light effects, a lens hood is even more necessary. Good shots, too, can be obtained on wet days with the aid of a Zodel lens hood—in fact, the scope of your photography is widened considerably during the autumn and winter months. Zodel lens hood is telescopic and folds flat for carrying. It is easily fixed to almost any camera.

State size of lens when ordering.

ONLY 7/6

## BRITAIN'S FOREMOST

9.5-mm.,  
16 - mm. and  
16-mm. S.O.F.  
FILM  
LIBRARIES

Every title in stock, all waiting for your autumn and winter home entertainment. Moderate hire charges. Time taken by film in the post is deducted from hire period and not charged for. From the smallest cartoon film to the most gorgeous Hollywood production—we have them all!

## Take Snapshots at Home with the **KODAK** **NIGHT PHOTOGRAPHY** **AIDS**

There's a new happy hunting ground for the amateur photographer—under his own roof! Look at the picture on the left. You can take this sort of charming, informal picture—easily, cheaply—by using Kodak Super Sensitive Panchromatic Film and one of the Kodak Lighting Aids.

**Kodak Super Sensitive Panchromatic Film.** The film of lightning speed; especially sensitive to artificial light. Made in roll film and film packs.

For night photography use Kodak "S.S. Pan" Film, plus either the "Photoflood" Lamp and "Kodaflector," or the "Sashalite."

**"Photoflood" Lamp.** Plugs into ordinary electric light socket; gives powerful continuous light sufficient for an immense number of pictures. New reduced price **2/6**.

**"Kodaflector" Reflector.** Specially-designed new-type reflector for "Photoflood." Increases efficiency of illumination at least  $4\frac{1}{2}$  times, decreases necessary exposure times accordingly. Fits on to any standard lamp-holder. Made of aluminium, collapsible. **3/-**

**"Kodaflector" Outfit.** Consists of "Kodaflector" Reflector plus handy wire stand, 9 ft. of flex, bayonet adapter to fit any electric socket, and bayonet lamp-holder for "Photoflood." **7/6**.

**Baby "Sashalite" Lamp.** The modern successor to flashlight. No smoke, no smell, no danger. Gives one brilliant flash; fired by pocket torch battery. **10½d.**

**"Sashalite" Amateur Outfit.** Consists of two Baby "Sashalite" Lamps, battery in holder, and collapsible reflector. **7/6**.

How this picture was made. Two "Photoflood" Lamps in "Kodaflectors" provided the light. Exposure  $1/25$ th at  $f6.3$  on Kodak Super Sensitive Panchromatic Film.

Write for free illustrated folder giving similar lighting diagrams and exposure details and other useful tips.

# MINIATURE CAMERA BARGAINS AT LOWER PRICES

We specialise exclusively in miniature cameras such as the Leica and the Contax. This fact has been appreciated by the photographic public, and deals involving miniature apparatus now tend automatically to come to us. Remember, by buying your camera or enlarger from us, you will be entitled to very special consideration at any time you may wish to dispose of it—either for cash or part exchange. Every miniature camera of distinction, together with a full range of accessories, is to be seen at our showrooms. A few of our second-hand guaranteed apparatus:

 Double-claw Pathe Cine Projector, with motor drive, super attachment, Hermast anastig. lens, added resistance and travelling case. Cost £14 1s. £8 17 6

IF IT'S NEW—  
WE HAVE IT!

## FILMO STRAIGHT "8"

The smallest cine camera in the world. Daylight loading. Takes 30-ft. spools of film. Built-in exposure chart, 4 speeds. With T.T.H. 1/2.5 lens. £19:15:0  
 Nine monthly payments of 48/1.

## THE ENSIGN 300-B

Fitted with 300-watt 6-coil single-plane matched filament lamp with matched reflector and condenser. For 16-mm. films. Operates on all voltages 100-250 (A.C. or D.C.). Compact and portable. £29:10:0  
 Nine monthly payments of 68/10.

## SUPER IKONTA

Model No. E30/16. Takes 12 pictures on 3 1/2 x 2 1/4-exposure roll film. Distance meter coupled with the focussing. Direct built-in view-finder. Compur Rapid shutter, speeded to 1/400th sec. With 1/2.8 Zeiss Tessar lens. £28:5:0  
 Nine monthly payments of 66/-.

VOL. LXXX. No. 2448.

MANY more amateur photographers are now realising that there is no necessity to put away their cameras during the autumn and winter months and picture-making out of doors can be continued as successfully as in summer-time. The enthusiastic beginner, however, should not make the mistake of expecting too much when dealing with autumn landscapes. Vivid colouring is often their principal attraction, and the black-and-white result is frequently disappointing. A little forethought before making the exposure will save many films being wasted. It should be considered seriously whether the scene depends entirely on the colours for its effect, and, if so, it is well to leave it alone. For this reason the frequently advocated plan of using a piece of blue glass or celluloid which can be easily carried in the pocket is particularly applicable to the present time of year. If the proposed picture is looked at through this the effect will be to give an apparently monochrome effect. If the scene, so viewed, is not entirely satisfactory it will be realised that it is the colour of the subject which has proved its greatest attraction, and a better composition in which light and shade play an important part should be sought.

### Autumn Light.

Outdoor workers at the present time of year should remember that the sunlight is much weaker as the year goes on, and, later in the day, yellow light predominates. This calls for panchromatic material, and the fact that snapshot work will not be so easy for the owner of a camera fitted with a lens with a small aperture is to a certain extent a blessing in disguise. Longer

## TOPICS of the Week

LONDON LANDSCAPES (No 37).

*Autumn morning in Hyde Park.*

exposures are called for, and the camera must be held on a tripod or some other support. For this reason greater care will be devoted to the choice of subject and the exposure than would be the case if indiscriminate snapshotting were still as possible as during the bright days of summer. Among the many subjects that the amateur should attempt during the autumn with a view to picture-making are the woodlands that may be in his neighbourhood. Here the shafts of sunlight coming through the trees on a bright day make very effective pictorial compositions. The late afternoon will be found best for this work, and this is another reason why a tripod will be necessary, as fairly long exposures will be called for; but the pictorial results—obtainable at no other time of year—will be worth this slight extra trouble.

### Beginner's Luck.

"Beginner's luck" is by no means an uncommon saying in the world of amateur photography, and many of our readers may have heard or known of beginners getting the most artistic or technically perfect pictures from their earliest exposures, results which have scored in competitions or have been published in the newspapers as news pictures. In most cases such results are more by accident than by design, but most encouraging they are to beginners. A correspondent tells of a thirteen-year-old lad who left his Cambridgeshire home to spend a day at Clacton, the event being a choirboys' outing. On his arrival at the seaside he bought a 5s. camera, the first he had ever handled, the dealer putting in a film and telling the lad how to work it.

The eight-exposure film was taken home, where it was developed and printed by a local chemist, all the negatives being good. Of these eight exposures two have captured cash prizes in competitions, while a third has been published in a local newspaper as a news picture, and the lad has been paid for it. The youngster may have some knowledge of suitability of subject, and of composition, but many have said, or will say, that his success was due very largely to the excellent cameras and films now obtainable, and to modern methods of developing and printing.

### Picking out a Detail.

We notice that in the illustrated journals on the Continent it is becoming the fashion to print a large picture of any topical event, and in the corner to have a small inset of a detail in the same picture much enlarged. For example, one French paper publishes a page of the doings of the Prince of Wales, and to each of the half-dozen pictures attaches a little enlargement of His Royal Highness's features, making it an interesting study

in varied expressions, which are quite lost in the larger picture. The effect is that of the cinematograph "close-up." There seems to be an idea in this for those who submit photographs with a view to publication. It might be useful sometimes to pick out what one judges to be the most important detail, enlarge it up, and attach it to the main print. It is a form of pictorial emphasis, like underlining a written word, or italicising a line of print. Incidentally, even if the inset were not published, it would enable editors perhaps to see more merit in the picture than a first glance at a mass of detail might suggest.

### How Lawrence Began.

Perhaps it is not generally known that T. E. Lawrence—Lawrence of Arabia—whose name still casts a spell, began his career as a photographer. We were fortunate enough to meet the other day a man who has spent the greater part of his life in the Near East, and who could remember Lawrence when he first crossed over to Asia. He says that he went on foot, and his principal luggage was a camera. He jour-

neyed in this way from Haifa to the Taurus mountains and around Northern Mesopotamia, and he brought back from that expedition photographs of every mediæval fortress in Syria. There it was that he got inspiration for his first big job, which was a photographic enterprise—the photography of Hittite inscriptions and remains—and perhaps none of his later more resounding adventures gave his mystical spirit greater pleasure.

### Cyanide.

There is a popular idea that if anybody commits suicide by taking cyanide he must be a photographer, or, conversely, if a photographer commits suicide, that is the way he does it. One police surgeon in our hearing the other day extended it a little, but suggested that if cyanide were taken it was usually by either a photographer, a jeweller, an entomologist, or a chemist. But really, the impression must not get about that photographers dabble in poisons. Many chemicals used in photography are, of course, poisonous if taken in sufficient quantities, but the same applies to some medicines.

## READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with on this page week by week. Other replies appear as usual on the last page.

### Subjects and Exposure.

*I use an old Watkins' meter as an aid to exposure, but am rather in the dark about making allowance for the character of the subject. Is this of much importance? R. J. (Lowestoft.)*

It is of vital importance; to ignore it is as bad as to "guess" exposures for all cases.

You say you use an "old" meter, but it is necessary from time to time to get fresh refills and the latest speed list of plates and films. You should also thoroughly master the instructions issued with the meter, as the instrument must be used correctly and with discretion; and, as with all meters, a certain amount of practical experience is necessary to get the best results.

Such an actinometer gives a reasonably accurate indication of the photographic value of the light at the time of testing, and the subsequent setting of the scale, based on this, takes into account the speed of the plate or film (according to Watkins' rating), and the stop used. The resulting indicated exposure is that for a "normal" subject, and any departure from this must be carefully considered and allowed for.

If you will refer to our own exposure table (October 2nd), you will at once see the importance of this. For example, in the first column, all other things being equal, the variations in exposure range from 1/25th of a second to 6 seconds, these variations resulting solely from the differences in the character and situation of the subject.

This is where judgment and experience come into play. Attempts have been made to give typical illustrations of different classes of subjects, but although these are helpful it is impossible to allow for the variety of subjects that, in

spite of their apparent dissimilarity, really come under the same category as regards exposure. An important consideration is the character, extent and distance of shadows and dark areas.

You should also bear in mind such general principles as that a subject with extreme contrasts of light and shade requires full exposure and shortened development time; while one that is flat and lacking in contrast may be improved by minimum exposure and full development.

With many modern and expensive forms of meter some difficulties are minimised or removed; but there is no meter of any kind that does not require to be used "with brains."

### "Continuous" Developers.

*What types of developers are suitable for continuous use in large tanks, of course with the necessary reinforcement?*

A. A. L. (London.)

There are several kinds of such developers, all of which work satisfactorily provided that the reinforcement to which you refer is carried out methodically and scientifically. They are obtainable commercially, with instructions and materials for reviving. The longest life in such conditions is claimed for metol alone, but for various reasons a combination of metol and hydroquinone is more generally used for the purpose.

Other suitable reagents are paramidophenol, ortol, adurol, and glycin, with or without the addition of metol. Pyro, very suitable for other purposes, is unsatisfactory for this. In all cases, naturally, there is a limit to the time for which any developer can be safely used.

# Cleanliness in Photography

Many photographic failures are the result of chemical dirt. In the following article some points of importance to all amateur photographers who are concerned with good technique are dealt with.

**C**LEANLINESS in photography has never been of greater importance than at the present time, when most photographers use a small camera and demand prints of large size without loss of quality.

Those who see much amateur work, and who are requested to explain the cause of mysterious failures for which the manufacturer is frequently blamed, will generally find that in most cases stains, marks, or spots, etc., are the direct result of chemical contamination.

## **Chemical Cleanliness.**

The term "chemical cleanliness" means much more than the term implies in the domestic sense. A dish, for example, may be clean and free from stain, yet be impregnated with chemicals from former operations, which have the power to retard some subsequent process.

Every photographer has impressed upon him, for instance, the importance of keeping the hypo dish for its special purpose alone, and few would be so unwise as to attempt the development of negatives in such a dish, yet it occasionally happens that this is done after the dish has been merely rinsed in water.

When a tank is used for developing and subsequent fixing and washing of the same film, as in the case of the Correx and similar tanks, the action of the hypo on the container is not of long duration, and the washing that follows is sufficient to remove all traces before the tank is dried and prepared for the next film to be developed.

Hypo can be transferred to the developer by splashing it about in the dish containing it, or by holding the negatives in such a position that drainings run into the developer. The photographer's fingers can also transmit hypo.

Spilt solutions can generally be avoided by the use of "deep" instead of the shallow dishes, and by practising gentle rocking, which is all that is necessary.

If solutions become accidentally spilt they should be immediately wiped up, and not, as is so often the case, allowed to dry up. If this happens the dark-room becomes dusty, and with dust of a very dangerous type to photographic apparatus, that of dry chemical substances. If these find their way to sensitive material trouble will certainly be experienced, and it may be impossible to remove the effects created by this cause.

Hypo, for example, if allowed to dry, forms a white fungus-like growth which is distributed in dust. Developers containing amidol dry up, and by such dust falling upon sensitive material black spots are produced.

## **The Dark-room Towel.**

One of the most prolific sources of mysterious stains and markings on negatives and prints is the dark-room towel. Many amateurs, otherwise most careful in their attentions to dishes, measures, tanks and bench, overlook the towel that may be fairly saturated with dry or drying chemical solutions and remain in use for months. In this condition it is inevitably a carrier of contamination.

While it is essential to keep a towel specially for the dark-room, one is not sufficient; two, at least, if not three or four, should be reserved for the purpose.

These can be of a quite cheap variety and, if bought specially, should be of a distinctive colour or pattern so that they do not get mixed up with other towels of the household.

The ideal method is to have two in commission at the same time, each hung in a different place, one for wiping up spilt solutions, etc., and the other for the hands. The hands and fingers, in any case, should always be rinsed in clean water before drying on the towel.

After a spell of work in the dark-room all dishes and measure-glasses should be washed and drained, and

the bench, etc., cleaned up. The towel used for the purpose should then be taken away and washed and replaced by the one used for the hands. A clean towel for the hands is then hung up in readiness for the next visit to the dark-room.

While on the subject, the amateur who wishes to avoid stained fingers and nails from contact with developers, etc., should keep a basin of clean water handy in which a crystal of citric acid has been dissolved. Half a lemon and a nail brush will also prove useful. Immediately after dabbling in the chemical solutions the fingers should be washed in the basin of water and, if worked into the half-lemon first, freedom from stained fingers will be assured.

Chemical-free fingers and clean towels will work wonders in the avoidance of stains, etc.

## **In General.**

Frequent cleaning of the dark-room, which means the washing down of the bench, shelves, and the outsides of bottles which contain solutions, should be regarded as one of the most important operations in photography.

All waste material should be at once discarded, and not allowed to lie about in a wet state. Dishes should be frequently scoured with a good domestic cleaner such as Vim and well washed out afterwards.

If dishes and measure-glasses get stained, and these stains defy removal by ordinary methods the following is effective:

Two teaspoonfuls of potassium bichromate are dissolved in about five ounces of warm water. When dissolved, about one ounce of strong sulphuric acid is added, and the water made up to ten or twelve ounces. A little of this solution poured into a dish will clean it in a few seconds. A small mop should be kept specially for measure-glasses. It is a good plan to keep the solution in a wide-mouthed bottle, as it may be used repeatedly.

# The GENESIS of an Exhibition Picture

By  
G. L. HAWKINS.

THE beauty of trees is so obvious that we often overlook it. Yet, with all their beauty, trees are a subject over which the photographer must exercise great care and thought if his rendering is to retain, when reproduced in monochrome, those so obvious qualities of beauty.

Design or pattern is the feature which is usually the *motif* of a tree picture, especially in the case of close-ups of trees. The design will depend entirely upon viewpoint. A low viewpoint helps to accentuate height, and, moreover, often brings the sky-line lower in the picture, sometimes a desirable feature, particularly where surrounding woods do not fall into the desired composition.

To make really satisfactory tree pictures, as opposed to pure photographic records (for which the writer has all due respect) it is nearly always necessary to remove by a process of gradual elimination branches which do not fall in with the scheme of composition, and, quite probably, to add features without which the final print would be incomplete or in some way unsatisfactory from the pictorial point of view.

It is the purpose of this short article to explain, in as few words as possible, one method of carrying out this work of picture-building. To assist in explaining the general procedure adopted by the writer reference will be made to the print entitled "Copper Beech and Silver Birch."\*

These obviously attractive trees were photographed with the camera on the ground, tilted upwards so that only the bank upon which the trees were growing came in the base of the picture.

A straight print from the original quarter-plate film negative (reproduced herewith) shows that the subject is one which contains some of the essentials for a picture plus a considerable amount of mixed and twisted branches, a tangle without design, and a distant hillside which plays no part in the composition.

Quarter-plate is too small for all the hand-work that would be necessary, so the negative was enlarged on to a whole-plate (fine-grain ordinary). This enlargement to a whole-plate transparency was carried out with a view to producing an image of maximum contrasts and full density.

From this transparency some of the unwanted parts were removed by immersion of the plate in potassium cyanide-iodine reducer, at a strength, found by experiment, which reduced high-lights first. Before any of the wanted tones (those of the trees) were gone, the plate was removed from the reducer and rinsed. The positive now contained trees of about normal density and completely clear glass where there was once sky tone and hillside.

The undesirable branches were now bleached away by the application, with a brush, of strong reducer. No great skill was required, as the parts to be removed were, except where they joined the main trunk, surrounded by already clear glass.

As it was intended to add a sky to complete the pictorial design the trees and foreground on the otherwise clear plate had to have sufficient density to appear in their proper place in the tonal scale when the sky tones were added.

It was not satisfactory to make simply a sky transparency and place the trees over it. Except in the case of a sky containing very little tone differences such a procedure means a

great deal of hand-work subsequently to correct false tones which appear in the tree trunks and foreground.

The correct density for a transparency depends entirely upon the proposed sky tones, and can only be judged after some experience, it being a matter of visualising tones yet to be added. Should the tree transparency be judged of insufficient density, it should be intensified, choosing an intensifier according to the degree of intensification required.

The next stage, therefore, was the production of a cloud transparency having clear glass where the trees and foreground appeared when the two transparencies were bound together. The selection of a suitable cloud negative will have been made previously; satisfactory pictures do not "happen," they are preconceived.

The selected cloud negative was printed by projection on to a whole-plate, having first placed the tree positive over the unexposed whole-plate and in contact with it. This positive acted as a mask allowing the sky to be printed fully through the clear glass and leaving little or no impression in the place occupied by the trees and foreground. Again, fairly strong contrasts were aimed at, so that traces of tone

which may have printed in the parts that should be blank could be removed by immersion of the plate in a weak reducing bath.

There were now two whole-plate positive transparencies, one of the trees and foreground with clear glass elsewhere, the other a sky transparency with clear glass foreground and trees. When placed together, emulsion sides in contact, they could be accurately registered.

Before fixing them together, however, the opportunity was taken of doing any necessary pencil-work that was possible only in the positive stage. The use of matt plates simplified this. The finished positives were placed face to face with a little adhesive in the corners and carefully registered.

The last stage was to make a negative by projection from the combined positive. A whole-plate matt cut film was used. This final negative was retouched according to the extent to which the high-lights required brightening, and straightforward enlargements were then made in the usual manner.

Print from the original negative. See reproduction of finished picture on Art page in this issue.

\* This picture is exhibited at The London Salon of Photography, now open at 5a, Pall Mall East. It is reproduced on one of the centre Art pages of this issue.

# SUPER IKONTA

No. 530/16

The New SUPER IKONTA takes eleven pictures  $2\frac{1}{4} \times 2\frac{1}{4}$ " on the usual  $3\frac{1}{4} \times 2\frac{1}{4}$ " roll-film spool, and possesses all the advantages of the usual miniature camera.

Built-in distance meter automatically coupled to lens focussing. ⚙ Automatic device which absolutely prevents double exposures. 📏 The accuracy of the distance meter makes the SUPER IKONTA suitable for use with the large-aperture ultra-rapid Zeiss Tessars f/3.5 and f/2.8, giving microscopic definition. ⚙ Zeiss Tessar f/2.8 is the fastest lens fitted to a roll-film camera of this size. ⚙ Compur Rapid shutter with exposures up to  $1/4000$  second brings even the most rapid sports pictures, as illustrated above, within the scope of the camera.

Zeiss Ikon products are stocked by most good camera shops. Name and address of nearest dealer on request.

ZEISS IKON LTD.,  
11, Mortimer House,  
Mortimer Street,  
London,  
W.1

## YOU CANNOT DO BETTER

### THE LEITZ 'FOGOMAT' ENLARGER

With Automatic Focusing.

Takes the standard 5-cm. focus Leica lens, screw-in fitting, automatic focusing adjustments scaled from 2 diameters up to 10 diameters. Will take negatives 18x25 mm., 24x36 mm., 3x4 cm., and 4x4 cm. Metal masks can be supplied for any of these sizes. **£16:6:6**

### LEITZ VALOY ENLARGER

£9:11:6

Nine monthly payments of 22/4.

### PATHÉSCOPE 200 - B PROJECTOR, 9.5-mm.

#### OUTSTANDING FEATURES:

Fitted with highly efficient 100-watt direct lighting system, giving a brilliant screen picture 10 ft. wide. Flickerless projection. Very compact. Fan-cooled and asbestos-lined lamp house. Simple threading. Universal tilting movement. Motor rewind for use on A.C. or D.C. supply, complete with lamp and motor drive for use on 100-volt circuit, 300-ft. empty reel and flex. **£15:0:0**

Resistance for use on voltages 200 to 250, extra. **£1:15:0**

#### £5 REDUCTION!

### A BRAND NEW ZEISS IKON IKONTA

Six pictures 3x2 in. for tenpence.

f/4.5 Zeiss Tessar anastigmat, ring control Compur shutter, speeds 1 to 1/3000 sec., T. and B. Lens focusing. Self-erecting front. Brilliant reversible and direct-vision finders. Complete in maker's box with instruction book and wire release. **SPECIAL PRICE £5:7:6** Nine monthly payments of 12/7. Solid leather case, 4s. 9d.

f/2.9 Schneider Radionar anastigmat, delayed-action Compur shutter, speeds 1 to 1/250th sec., T. and B. **£6:15:0**

Nine monthly payments of 15/6.

16 pictures 2 1/2 x 3 1/2 on standard 2 1/2 by 3 1/2 Roll Film.

Body of camera is moulded from practically indestructible plastic material, the surface being attractively finished. Leather bellows, self-erecting front, lens focusing.

PROBABLY the greatest advantage of the various

photographic methods of pigment printing lies less in the means of control with which they are generally associated, than in the quality of gradation shown by the results at their best.

The difficulties and uncertainties of these processes, however, set me trying to obtain in straight bromide prints the richness of quality and better rendering of values that only expert and successful pigmentation can give, but with greater ease.

#### **Pigment Texture.**

At the same time I hoped for another, though minor, advantage of prints in pigment, namely, a "texture of image" peculiar to the process and inherent in it. All forms of graphic art other than ordinary photographs show such a texture; oil-painting has its "impasto"; water-colour, an irregularity due to the heavier paint settling into the hollows of the paper used, and so on.

It is true that the painter in oils might finish his picture so that no brush-marks remained, the water-colourist might paint on bristol-board, but neither does; therefore we must suppose that he finds this "texture of the image" a desirable attribute. Now it is not, of course, proposed that these results should be imitated; but, in avoiding imitation, there is no reason why the photographer should forgo any effective texture that is inherent in, not superimposed upon, the process he employs.

As to the rich gradation of bromoil, I remembered that this was to be found also in a very fully-exposed bromide viewed as a transparency. But over-exposure and full development, such as the transparency had been given, would result in buried detail; but what if such a print were treated with a reducer? I tried, only to find, as was to be feared, that all reducing agents either stained or acted irregularly or attacked the highlights disproportionately.

#### **A New Method.**

Then it occurred to me that, instead of treating the finished print, I might try reduction *immediately after development and before fixation*. I chose acid permanganate with sodium chloride for my preliminary attempt and the first print was a success, a far better rendering of the negative than ordinary development would give. And, incidentally (I was using a rough paper), the image had a pleasant texture of its own.

# *A New Method of Print Production*

## **SECURING PIGMENT QUALITY in BROMIDE PRINTS**

By R. LLUELLYN.

Only slight modifications have been made since, and the method stands as follows:

Prepare the reducer or "etch."

A. Common salt 25 per cent solution .. 3 drs.

Sulphuric acid 15 per cent .. 1 dr.

Water to .. 10 oz.

B. Pot. permanganate 5 per cent solution .. 3 drs.

Water to .. 10 oz.

This quantity for a 10×8 or 12×10 print.

Give twice to six times the normal exposure. The only difference in the result will be that the longer exposures make for enhanced granularity. Three or four times is generally the most satisfactory increase.

Develop fully, to be on the safe side, say 50 per cent longer than the normal time.

Rinse the developed but unfixed print and leave it in water while you mix A and B and add water equal in bulk to the mixture. This dilution is right for a ×3 exposure; the extra water may be halved for a ×4 or omitted for a ×6 exposure.

#### **Applying the "Etch."**

Drain the print and flood with some of the "etch," being careful that this is not poured directly on to any part that will appear in the final image. To provide for this it is best to have masked one end or side of the paper in exposing it. As soon as the print has been flooded with the etch a strong white light should be turned on.

The etch will soon become discoloured to a brown-red in place of magenta. When this happens, pour it off, rinse and replace by fresh. This will last longer but should be replaced again. The third or fourth instalment will probably make the print nearly light enough, and it should now be watched carefully. As soon as the very highest light is cleared of silver, the print should be rinsed till the

washing-water is free of any pink coloration (two or three

changes) and then placed in a normal acid fixing bath.

Here an astonishing change takes place in its appearance. The image, which was flat, veiled and stained, clears almost at once and stands out boldly in a rich charcoal black. After fixation is complete the print needs only to be washed and dried in the ordinary way.

Prints by this method should be at least as stable as ordinary bromides, and probably are more so, because the image is all contained within the emulsion.

#### **Final Points.**

If an absolutely matt paper is employed the print will require waxing or rubbing with "dope," so that the image shall not appear buried.

The additional cost of the process is negligible, and the extra bath is much more than compensated for, both in price and time, by the fact that the latitude of exposure is so great that it is almost impossible to waste a sheet of paper. It must not be expected, however, that an exposure increased only by 1½ times will give such characteristic results as will an increase of six times the normal.

The greatest control of gradation can be exercised by modification of the developer. Thus, pyro with extra sulphite may be employed; strong and heavily dosed with bromide for weak negatives, dilute with no bromide for harsh ones; or the relative quantities of hydroquinone, metol, bromide and water, may be varied with M.Q. The bad colour that would ordinarily arise will be corrected by the subsequent etch.

Local modification of values may be practised, for which purpose the etch can be applied either with a plug of cotton-wool when the print is lying in water, or more dilute with a quill-mounted brush used on the surface-dried print. But this is a refinement that is not advised for the first attempt.

It will be found that the process is a joy to operate; I know of nothing in the whole range of photographic printing (except perhaps the emergence from the press of a successful transfer) so satisfying to watch as the change that comes over an etched print in the fixing bath.

[Prints made by this method—submitted by the author of the above article—show a remarkably rich quality in tone and texture that bears out all the claims made for it.—ED.]

# DIARY of a Minia

## Pictures for Busy People

By DONALD G.  
SHELDON.

*Monday Morning.*

I AM a busy man, with very little opportunity for going about in search of "pictorial" subjects. In spite of this, I probably secure a much larger "bag" of interesting pictures than many people with twice my leisure time. How is it done? Well, like this.

First of all, I have a pocketable miniature camera with a good lens and shutter. I keep it loaded, and I carry it *always*. Secondly, I have trained myself by constant practice to be "quick on the draw." And, thirdly, I keep my eyes "skinned" for subjects. Three simple things, but they make all the difference.

So many of the most attractive subjects are fleeting incidents which may happen anywhere. This is where the person with the ever-present pocket camera scores. Such a camera enables him to keep a photographic "diary" of things which interest him.

Many of these things he may never see again; if lost they are gone for ever.

Some are seasonal, like the fallen leaves and fruit-laden branches of autumn, and occur only once a year. I capture many of these subjects on the way to work or in the lunch hour; carry a miniature and do the same yourself.

I do not pretend that the miniature camera can entirely replace its bigger brothers, or that it is ideal for serious work. There is

still much work for which I find it best to use a focussing camera of the "hand and stand" type (e.g., still-life and architectural photography). But for casual subjects the quicker action and unobtrusiveness of the miniature are great advantages. The picture

*A little Advice.*

*Autumn Rain.*

may often be taken and the camera stowed away again without the models knowing anything about it. And that is where a good deal of the fun comes in.

In order to give my little pictures the best chance of being good ones, I always carry a pale colour-filter and a clip-on lens hood, and I use fine-grain panchromatic film. This film, when carefully developed in a fine-grain developer, will stand any amount of enlargement, and in conjunction with the filter gives beautifully

correct tones.

Of course, I do not use the filter *every* time, but, where the sky is included or the subject is colourful, the improvement with the filter is enormous. The increase in exposure demanded by the filter is so small that for practical purposes it may be ignored. The lens hood is used always; it brightens up the picture, and is indispensable when photographing against the low-angle autumn sunlight.

The accompanying selections from my photographic "diary"

*"Will he give us a ride?"*

# urist

show the kind of thing a busy man may secure with very little trouble. "Monday Morning" is a good example of the quality of tone rendering given by modern panchromatic film, and also of the great depth of focus of the miniature lens when a medium stop ( $f/8$  in this instance) is used. There are times when too great depth is not required. For portraits out of doors it might well be a nuisance, as the model would be too much "mixed up" with the background. With the better-class miniature cameras this trouble is easily overcome, as the lenses are usually of  $f/4.5$  or greater aperture. By using the larger stops for close-ups the background is nicely diffused.

My miniature camera, like several other makes, is provided with a depth-of-focus table calculated for all the various stops and distance settings. This most useful feature enables me to know at a glance the exact amount of depth I shall get on any occasion, and to set my stops according to the effect desired. Thus the loss of visual focussing is not so great a sacrifice as might be thought. In indoor work or in dull light the results may even be more certain than those got by inspection of a dim screen image.

Many photographers have the

When Autumn weather prevails, there is less inclination to carry bulky apparatus, and many good pictures may be missed. The unobtrusive portability of the miniature camera, with its great depth of focus at large apertures, makes it an ideal instrument for autumn photography.

*Scissors and Paste.*

*"One o'clock, Two o'clock —"*

ball-and-socket head to the tripod allows the camera to be directed towards the subject from any desired angle.

Not the least advantage of the miniature camera is its small running cost, many models being loaded with ciné film, or taking sixteen exposures on standard eight-exposure films. This enables one to be more lavish with exposures, and when a good subject turns up three or four shots from slightly differing angles can be taken quickly and at small cost. This is far better than risking all on a solitary exposure. Also, as at least sixteen exposures are available from a single loading, changing spools is a less frequent business than with larger models, and a good reserve supply of film is easily carried in very little room.

notion that the miniature camera is more or less a toy: good enough perhaps for casual snapshots, but useless for such work as indoor portraits or still life. I have therefore included "Scissors and Paste" to show that still-life subjects can be done (though admittedly not so easily) with a camera having no ground-glass focussing screen. A tape measure and the depth-of-focus table have to be used to ensure sharp focus in the part desired, and for close work a "portrait attachment" is necessary. My camera is fitted with one tripod bush, and a

*A Place in the Sun.*

# NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

**A Reminder.** Readers of "The A.P." are reminded that both the London Salon of Photography (5a, Pall Mall East) and the Royal Photographic Society's Exhibition (35, Russell Square) close on Saturday next, October 12th. Those who have not yet visited these two important London shows should hasten to do so while there is still time.

On Saturday, September 28th, the Photographic Miniature Postal Portfolio held its Annual General Meeting in London. Over sixty members attended, many coming long distances. The morning was spent at the London Salon, and the afternoon at the R.P.S. exhibition. The P.M.P.P. has now six circles, each of thirty members, and Mr. Geo. A. Slight (Hon. General Secretary), in his report, said it was seldom that any of the 180 members failed to submit an entry.

A new enlarger for use with small negatives has just been introduced into this country by R. E. Schneider, 189, The Grove, London, W.6. It is called the "Filmarus," and is made by Messrs. Muller & Wetzig, of Dresden. It is supplied in three sizes: for negatives 4x4 cm. (1½x1½ in.), 6x6 cm. (2¼x2¼ in.), and 6.5x9 cm. (2½x3½ in.) or smaller negatives. Illumination is obtained from a 100-watt opal lamp. A double anastigmat f/4.5 is part of the equipment, and special carriers for single negatives or strips with suitable masks are also supplied. The apparatus complete sells at £8 8s. Further particulars can be obtained from the above address.

In connection with the competition the Coronet Camera Co. is organising for work taken with their midget camera, they inform us that the supply of entry forms applied for already exceeds 120,000, and that a large selection of snapshots is reaching them every day.

Reels for holding 400 ft. of ciné film are being offered by the Camera Company, of 320, Vauxhall Bridge Road, London, S.W.1, at an extremely low price. They are made for either 9.5-mm. or 16-mm. film. For the former size they are supplied at three for 5s. 9d. or six for 11s. In the latter size, three for 6s. 9d. or six for 12s. 6d. We have examined the reel, which is well and strongly made of aluminium, with standard fittings. This firm also supplies a special "Vauxhall" Humidor Can for holding the reels when filled with film. Each is fitted with an absorbing pad for damping. These are selling at three for 3s. 6d. or six for 6s. 6d., and are worth the attention of every amateur cinematographer.

The Cinema Traders, Ltd., of 26, Church Street, London, W.1, have just issued an attractive little list of specialities that will appeal to many readers interested in projection work and photography with flood-lighting, etc. A copy of the list will be sent free on application to the above address.

**Change of Address.**—The address of the Professional Photographers' Association will in future be 49, Gordon Square, London, W.C.1. Telephone: Museum 7856.

The Southern Counties Salon of Pictorial Photography, held under the auspices of the Camberwell Camera Club, proved to be most successful, and at the request of the management of the Astoria Theatre, Brixton, wherein the Salon was held, the show was extended a further week, thus being on view for one month. It is estimated that many hundreds of visitors to the Astoria saw the show each day.

In the winter syllabus of the Bradford Photographic Society we observe a distinct break with tradition. For many years past a new lecture by Mr. Alexander Keighley has been given on the opening night, and practically all his lectures have first been published, and his slides first shown, in this way. This year the session is opened by Mr. Fred A. Jordan, with one of his popular and well-known lectures on the Zoo, which may well prove to have an even wider appeal to non-members. It is very satisfactory, however, to observe that Mr. Keighley's new lecture is merely delayed, and will be given early next year.

The Galashiels Camera Club start their second winter session on October 11th, and are meeting in future on every alternate Friday. The Secretary, Mr. P. H. Cartwright, 52, High Street, Galashiels, will be glad to get in touch with any photographers residing in the neighbourhood, as this club is the only Scottish club south of Edinburgh.

A series of demonstrations and practical work in photography for young men from fourteen to eighteen years of age has been started on Thursday evenings at St. Dunstan's Road Men's Evening Institute, Fulham Palace Road, W.6. The fees are merely nominal. Full information will gladly be furnished by the Head of the Institute.

## Exhibitions and Competitions

CURRENT AND FUTURE.

Notices of forthcoming exhibitions and competitions will be included here every week if particulars are sent by the responsible organisers.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers. Entries, October 31. Rules in issue of September 25.

The Amateur Photographer Annual Lantern-Slide Competition.—Entries close October 31. Conditions in this issue.

California Pacific International Exhibition, San Diego.—May 29–November 11. Miss Ruth Kilbourne, Secretary, Exhibition Headquarters, Balboa Park, San Diego, Cal., U.S.A.

Paris International Salon.—October 5–20. Secretary, M. E. Cousin, 51, Rue de Clivry, Paris.

London Salon of Photography.—Closes October 12. Secretary, London Salon, 5a, Pall Mall East, S.W.1.

R.P.S. Annual Exhibition.—Closes October 12. Secretary, 35, Russell Square, W.C.1.

Irish Salon (to be held at Mansion House, Dublin).—Open, November 2–9. Particulars from Hon. Secretary, Irish Salon of Photography, 18, Morehampton Road, Dublin.

Rotherham P.S. International Exhibition.—Open, October 16–19. Hon. Exhibition Secretary, E. George Alderman, Ruardean, Newton Street, Rotherham, Yorks.

Royal Photographic Society Exhibition of Cinematography, 35, Russell Square, London, W.C.1.—November 11–30.

Indian International Salon (promoted by Camera Pictorialists of Bombay).—Open, November 17–30. Hon. Salon Secretary, F. R. Ratnagar, Central Bank Building, Fort, Bombay, India.

G.W. Rly. "Camp Coach" Holiday Competition.

—Prize, one week's holiday in camp coach during 1936 holiday season. Photographs should depict any aspect of camp coach holiday. Entries due, October 31. Further particulars from Superintendent of the Line, G.W.R., Paddington Station, W.2.

Canadian International Salon, National Gallery of Canada, Ottawa.—November 6–21, and afterwards in other Canadian cities. Entry forms and further particulars from Exhibition Secretary, Canadian International Salon, National Gallery of Canada, Ottawa, Canada.

Seventh Western International Photographic Salon.—November 23–30. Entries close, Monday, October 28. Particulars and entry forms from the Organising Secretary, W. H. Hill-Muchamore, 24, Church Road, Redfield, Bristol, 5.

Cape of Good Hope International Salon (under the auspices of Cape Town P.S.).—Entries due, November 19; open, January, 1936. Hon. Salon Secretary, Richard Dekenah, P.O. Box 2431, Cape Town, South Africa.

IXe International Kertsalon Fotografische Kring "Iris".—Open, December 22–January 5, 1936. Entries close, November 15. Particulars and entry forms from J. Van Dyck, Secretary, "Iris", 69, Ballaerstraat, Antwerp.

Third (Second International) Wilmington Salon of Photography.—Open, January 6–26, 1936. Last day for entries, December 15, 1935. Particulars and entry forms from the Salon Committee, Delaware Camera Club, P.O. Box 818, Wilmington, Delaware, U.S.A.

Leicester P.S. International Exhibition.—Entries,

January 24, 1936; open, February 24–March 7, 1936. Exhibition Secretary, H. Foscutt, 19, Daqceaster Road, Leicester.

The 40th Annual Exhibition of the South London P.S.—Open, February 15–March 14, 1936. Entries close, January 21. Further details and entry forms from Hon. Exhibition Secretary, H. S. Adams, 40, Stockwell Park Road, London, S.W.9.

Scottish National Salon.—February 8–29, 1936. Entries close, January 11. Particulars and entry forms from the Hon. Salon Secretary, Norman G. Brown, 36, North Lindsay Street, Dundee.

Ilford Photographic Society.—Annual Photographic Exhibition. From Monday, March 2 to Saturday, March 7, 1936. Closing for entries, Saturday, February 1, 1936. Particulars and entry forms from E. G. Roughton, 63, Havering Road, Romford, Essex.

City of London and Cripplegate Photographic Society.—Thirty-first Annual Photographic Exhibition from March 16–21, 1936. Entries close, February 10, 1936. Particulars and entry forms from the Hon. Exhibition Secretary, A. C. Mundy, 11, Monkham Lane, Woodford Green, Essex.

VIIe Salon International D'Art Photographique de Bruxelles, 1936.—Open from March 21–April 5, 1936. Entries close, February 25. Particulars and entry forms from M. M. Devaivre, 152, Rue Markelbach, at Brussels 3, Belgium.

Darwen Exhibition of Photography.—April 20–May 2, 1936. Entries close, March 19. Particulars and entry forms from the Secretary, J. H. Woods, South Down, Bolton Road, Darwen.

### Exhibition of Kinematography

10 a.m. to 6 p.m. (Sundays excepted).

ADMISSION FREE.

# The Amateur Photographer and Cinematographer

## Annual Lantern-Slide Competition - 1935

**Closing Date:**  
**THURSDAY, OCTOBER 31st.**

### Classes and Subjects.

- CLASS I.—Landscape, with or without figures, sea subjects and river scenery.
- CLASS II.—Portraiture and figure studies, whether indoor or outdoor pictures.
- CLASS III.—Architecture, interior and exterior.
- CLASS IV.—Flowers, fruit and other "Still-Life" subjects.
- CLASS V.—Natural History subjects.
- CLASS VI.—Lantern slides in colour (not hand-coloured).
- CLASS VII.—Champion Class. Open only to those who have won silver or bronze plaques in *The Amateur Photographer and Cinematographer* Lantern-Slide Competition.

### Conditions and Awards.

(1) All classes are open to amateur and professional photographers without any restrictions. All slides must measure  $3\frac{1}{4} \times 3\frac{1}{4}$  in., and must be properly spotted for showing in the lantern.

(2) One silver plaque, one bronze plaque, and four certificates are offered in each class except Class VII. In that, the Champion Class, the award will be a mounted and signed exhibition picture by Mr. F. J. Mortimer, the Editor of *The Amateur Photographer and Cinematographer* and *Photograms of the Year*.

(3) All slides which receive any award will become the property of *The Amateur Photographer and Cinematographer*, and will be sent round amongst the societies and such other associations as apply for the loan of them. Any other slides may be selected for circulation in this manner, and will be paid for at the rate of half a crown each.

(4) Competitors may send any number of slides in any class, and may be recorded as winning any number of awards; but no competitor will actually receive in the competition more than one silver plaque, one bronze plaque, and one certificate, on which all his awards will be recorded. Competitors may enter in any number of classes.

(5) Each slide must bear the competitor's name, its title and its class. With the slides must be sent an envelope containing the name and full address of the competitor, a list of the titles of all the slides he is sending in, and the class in which such are entered. Particulars as to make of plate, exposure, developer used, etc., and other technical data which may be of interest for incorporation in the notes which will accompany the winning slides on their tour among the photographic societies, should also be given where thought necessary.

(6) A stamped and addressed label (not loose stamps) should be sent with the slides for their return if unsuccessful; but in no circumstances can the Editor or the Publishers accept any responsibility for slides sent in for competition, nor for their return; neither can slides be returned which are not accompanied by stamps as above.

(7) Not more than one slide from any one negative can be admitted, nor may any slide compete which has before won an award in these competitions.

(8) The last day for receiving is Thursday, October 31st. The slides must be well packed, and addressed "Slide Competition, The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and all carriage charges must be prepaid.

(9) In any case of dispute, the competitor agrees to accept the decision of the Editor of *The Amateur Photographer and Cinematographer* as final.

# how I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CCCII.

Mr.  
C. A. WHITE.

From information communicated to our Special Representative.

THE fondness for all kinds of pictures, and a desire to do something myself in the way of recording the beauties of landscape and sky, led me many years ago to start off with a half-plate camera and all its belongings into the vales and hills. After forty years of this work in what spare time I can find, I still get boundless pleasure in my quest of pictures, and I have no regrets for making photography my chief hobby.

To-day I use for most of my work a  $3\frac{1}{2} \times 2\frac{1}{2}$  reflex, and having several lenses to fit this outfit enables me to include a great variety of subjects. A favourite lens of mine is an old 9-in. Cooke for work in the open and on the seashore. Although I much prefer plates, I keep in the fashion by using packs and roll films. I always carry a

tripod, for I like to, give the longest possible exposure, so as to ensure getting the desirable thin well-graded negatives suitable for bromide enlargements.

"I never use a meter, but when I find a promising subject I make three or four exposures, having in view a soft negative for prints and a stronger one for slides. I experiment with most printing processes, but think that for ease of working and beauty of results a bromide print can hold its own with them all.

"The great point in making bromide prints is correct exposure; too short is fatal to tones, and too long gives bad colour. I always allow two minutes in amidol developer. During the printing of my enlargements I generally resort to some kind of shading or extra local printing to get a result to suit my re-

quirements. I print in clouds from a separate negative, and would emphasise the importance of a good and varied stock of cloud negatives. When I notice a particularly nice sky I shoot. For this purpose I prefer a between-lens shutter, and generally give  $1/25$ th second with a  $\times 3$  filter, and f/8 on Verichrome film. I use the developer diluted and keep the negatives on the thin side.

"I am fond of early morning work in the woodlands, and of the exciting close-ups of rough seas. Perhaps my love for photography is at its height when I can get to the back of the Isle of Wight with a good sou'-wester blowing; but such an opportunity is unfortunately rare in my case.

"In finishing prints I like to do everything myself. I mount the prints by the old-fashioned method of rubbing paste into the back with my fingers. My ideas about working on the surface of prints are no secret. I am a photographer, and will fake with photographic chemicals if required; but if I were judging a batch of prints I would reject all that were smeared with surface work.

"In the print called 'Storm Clouds' the effect is largely dependent on the sky and general atmospheric conditions, but the print is really a 'marine' subject of a type beloved by many of the older seascape painters. 'The Lily Pond' is a much simpler subject, and may serve to illustrate my fondness for wide variety, from studied compositions to mere pictorial notes.

"I strongly advise all beginners to read everything in 'The A.P.' and to enter the competitions. Without this form of friendly contest enthusiasm may wane. I also advise a close study of the reproductions—not with a view to imitation, but to see what is being done, and to learn from the published criticisms what is good or otherwise. I owe a big debt of gratitude to 'The A.P.' for helpful criticisms over a long period, and when I turn out a new work I invariably send it in to the competitions to get it placed and criticised."

(A further example of Mr. White's work is reproduced on one of the centre Art pages.)

THE LILY POND.

C. A. White.

# Pictorial Analysis

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

## "COPPER BEECH AND SILVER BIRCH," by G. L. Hawkins.

THIS picture was one of the most outstanding of the landscapes at the current exhibition of the London Salon of Photography. It is not easy to achieve a distinction in this particular sphere, as, for one thing, it is a class of work that bristles with difficulties and drawbacks, and, for another, if these be eliminated, the appeal of a landscape is not so immediately apparent as—for example—a portrait, figure study, or, generally, those types of work which disclose a human interest.

Nevertheless, its innate attraction may be more enduring, and so it is in this instance, although, contrary to the general rule, the pattern formed by the tree trunks against the sky is very striking and lends unusual force to the initial appeal. It is, indeed, arresting to a decided degree, but, on further contemplation, the first impression is sustained, and its essential beauties become more and more manifest.

The fine shape of the trees; the excellent way in which they are combined; the sunlight on their boles; the most pleasing of cloud forms, and a wholly admirable expression of the feelings of air and space are all good features; and, in the sum, afford an ensemble of such a charm that it becomes increasingly attractive the more it is studied. As far as the arrangement is concerned, it is necessary, in the interests of unity, that there should be a primary centre of attraction. This is to be found in the neighbourhood of the point (1), where not only does the most commanding of the trees have its origin, but the strong dark at its base, in contrast with the light of the cloud behind, ensures a very powerful concentration of interest.

So strong is it that, apart from anything else, it would be sufficient to localise the attention in its vicinity; but, in addition, the placing of the tree in the picture space confers an attraction that is no less effective,

for the position is forceful and quite strong enough, alone, to maintain its dominance.

In view of the great attraction exerted by these two factors—*chiaroscuro* and placing—there is no doubt whatever about the centre of interest, and, if only on these accounts, the needful feeling of unity is achieved.

All the same, it is heightened and

doing, an illusion of distance and space. It creates the feeling that between the trees and the lower parts of the clouds there is a tremendous distance, and, in conjunction with the suggestion of approach imparted by the lighter tops of the clouds, introduces a proper sense of a real recession of planes.

The clouds themselves, by reason of their nature, invite a feeling of wind and movement; they provide a worthy setting and display a beauty of form that admirably and naturally sets forth the grace and delicacy of the intervening trees.

It is, of course, pretty obvious that, while the tree on the left is the most important, it is scarcely significant enough to stand by itself, nor, in combination with the foreground and sky alone, to make a wholly satisfactory picture. It is essential that it should be supported, and this function is fulfilled by the introduction of the second tree (2) and its smaller satellites.

They also serve to intensify the interest, and, by force of imitation, react to enhance the dominance of tree No. 1. They complete and round off the scheme, and it is the way they are placed and the relationship they bear to each other that creates the sense of pattern which lends an immediate appeal to the picture.

Not only, therefore, is it well designed and arranged, but, in its effect of sunshine and in its suggestions of air and space it is also aesthetically pleasing and displays an attraction of a very high order. Elsewhere in this issue, Mr. Hawkins discusses his methods in a most clear and illuminating way, and the attention of the reader is specially directed for further details and guidance to his article. The skill with which he deals with pure landscape should serve as an incentive to others to study this form of pictorial work, nowadays somewhat neglected.

"MENTOR."

stressed by the connecting links of the lines of the other trees and their branches, by the mass of dark tone which forms the foreground, and, in the upper portion of the picture, by the suave and curving line of the tops of the clouds. Besides this useful function these elements also have another purpose. The deep tone of the foreground lends a sense of stability that is necessary on account of the height of the trees, and the impression of immensity that arises from the great masses of cloud, and it is of moment, again, in that it tends to throw the clouds back and introduce, in so

PRINTS FROM "THE A.P." BEGINNERS' COMPETITION.

1.—"The Boat House,"  
By Miss B. Alton.

2.—"Lovely Lane,"  
By N. Higham.

3.—"R.M.S. 'Windsor Castle',"  
By E. H. Paddock.

4.—"Gulls,"  
By B. Binsted.

5.—"Arab Village,"  
By D. R. Mackintosh.

6.—"Old Doorway, Tocester Church,"  
By Dr. R. F. Jarrett.

# PICTURES by Novices

*SOME CRITICAL COMMENTS on  
the Beginners' prints reproduced on the opposite page*

**D**ESPITE the title which has been applied to No. 1 of the prints reproduced on the opposite page—"The Boat House," by Miss B. Alton—it is apparent that the main attraction of the picture lies in the presence of the boat, its sail, and its reflection, and not in the structure in question. Its author would have been wiser had she refrained from choosing a title which, by directing the attention to a secondary element, proves somewhat misleading.

## **Title and Subject.**

The choice of a title may be a minor matter, but it is one that presents many difficulties. It is obvious that it should indicate both the author's intention and the subject of the picture, and if, in this instance, it be taken that the boat house is the subject, the queries immediately arise as to why it should be; why it is not brought more prominently forward; and why the boat, which has an infinitely greater attraction, should be included at all.

In the print as it stands, the boat house is an item of comparatively little significance. It cannot sustain the title role, for it is neither sufficiently prominent, nor has it the needed strength of position. Take away the portion of the print containing the boat and a good proportion of the foreground, and the position rights itself to some extent; but, even so, the subject lies rather in the lake and mountains, and the structure remains a lesser interest, although it might be held to serve as a peg on which to build up a composition.

On the other hand, if the boat be retained, it must be regarded as the centre of attraction, for, although it is badly placed, it is still the most prominent element. As such, it should be placed more "in" the picture, and then, of course, the title is inapplicable and inappropriate to the subject.

## **A Matter of Choice.**

To be perfectly frank, the arrangement of the subject material is not satisfactory, and it is scarcely possible to apply a suitable title in the circumstances.

If the boat were brought more into

the picture, as suggested, the subject might be called "The Boat," or some simple equivalent, but what is wrong is that the choice of subject in the first instance was ill judged, and no title can indicate a theme that is not properly carried out.

The same criticism regarding the arrangement cannot be directed against No. 2, "Lovely Lune," by N. Higham, for, in this respect, the lines fall together quite happily, and there is little doubt but that the river forms the subject.

But it is not clear, by any means, why the name of the river is qualified. The scene itself may have been quite pleasing to look at, but there is nothing in it to distinguish it from innumerable reaches in other rivers of similar form. Neither does it display such an aspect of beauty that warrants so appreciative a description, nor a term that is indicative of so high a measure of attractiveness as "lovely." It is nothing more or less than an exaggeration, and creates an anticipation that the rendering is incapable of satisfying.

## **Appropriate Description.**

As a representation of the topographical features of the Lune, it may serve a purpose, but its pictorial appeal is slight, and it is questionable if there is even a hint of what real loveliness the river may possess.

It would be far better if the print had been simply called "The Lune," for then, at least, it would describe what is represented without inviting any sense of disappointment.

No such feeling arises in the cases of Nos. 3 and 4, "R.M.S. *Windsor Castle*," by E. H. Paddock, and "Gulls," by B. Binsted, because the prints clearly show what is indicated by their titles. They may not show any particular measure of artistic attraction, although, technically, they are above reproach; but neither claims anything for itself that is not fully substantiated, nor are the titles at all misleading.

Their description is modest, free from exaggeration, and appropriate, and, in consequence, it can be said of them that they fulfil the purpose that was intended.

No. 5, "Arab Village," by D. R. Mackintosh, bears a title that is equally well chosen, and one that is amply sustained by what the print discloses.

## **Pictorial Appeal.**

It is fittingly described, but, though it makes no further claim, it does display something of an effect of sunshine—which may or may not be fortuitous—that lends it a measure of pictorial appeal. It would be better, it is true, if the effect were more concentrated, and not spread over so many different points; but, while such a state of affairs might have occurred under a somewhat different lighting, it is improbable that, at the time, any appreciable improvement could have been secured.

The lighting, at present, is too frontal, and it necessarily follows that the desirable proportion of shadow tone did not exist. To get it—and by so doing to limit the number of points of light—would mean the selection of a time either somewhat earlier, when the light would fall from a source farther back and from the right, or much later, when it would come from the left but at a similar angle.

How far this would be found feasible could only be determined on the spot. Nevertheless, it can be imagined by how much the appeal of the picture would be heightened if the light were concentrated almost exclusively on the wall of the building on the left—much as it is at present—but without those other lights on each side of it.

## **Sunlight and Effect.**

No one could quarrel, either, with the choice of title in the case of No. 6, "Old Doorway, *Towcester Church*," by Dr. R. F. Jarrett, for, on turning to the print, that is what actually is portrayed.

Here again, sunshine is present, and, as in the former instance, it confers a brightness and vivacity that would otherwise be unobtainable. In this case, also, it is rather too much inclined in a frontal direction, and, did it fall more from the side, not only would the proportion of shadow be increased, but the value of the sunlight would be correspondingly enhanced.

"MENTOR."

# With the Beginners

NOTES AND NOTIONS FOR THE  
LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

## CAMERA LIMITATIONS.—V.

I AM now going to try to sum up the main points in regard to the handicap of those beginners who have only a very simple camera. It will be remembered that the question was raised by a reader speaking for himself and others. They wanted to know how they could use their cameras to the best advantage until they could "procure a more expensive instrument" which would enable them to make "such glorious pictures as those found in 'The A.P.'"

The camera has only a "single" lens. The chances are, however, that it gives reasonably good definition, and it is a well-known fact that such a lens gives clean, bright pictures, because it is set well back, with the stop in front. It is, in fact, permanently hooded. It also passes more light, with a given aperture, than a lens with more reflecting surfaces.

A single lens does not render straight lines correctly, and near the edges of the field covered the curvature of the lines is very noticeable. Unless the subject includes long straight lines near the boundaries of the

*Sunset off the Isle of Wight.*

picture, however, the defect is not serious. It is not apparent in landscapes, portraits, etc.

The lens is "slow." A single lens seldom works satisfactorily at a larger aperture than  $f/11$ , and the biggest stop is sometimes even  $f/14$ . This is certainly a handicap. It means that hand exposures can be given only in a good light. Even in the best of light "high-speed" work is out of the question with so small a stop; and there is no hope for "snaps in the theatre" and that sort of thing.

The beginner could widen his scope if he would only use a tripod at times. He could then, with a wire release, give the longer exposure necessitated by the small stop, say from a fifth of a second upwards. Some of the most "glorious" subjects permit this longer exposure. All the best pictures are not dependent on big apertures, high shutter speeds, or artificial-light snapshotting. The fact must be recognised, nevertheless, that a small lens aperture limits opportunities. On the other hand, it gives greater depth of definition, and reduces the risks of incorrect focussing.

The shutter has only one, two or three automatic speeds. This also is a

*Bournemouth Pier from the Cliffs.*

drawback. If there is only one speed it is generally of the order of  $1/25$ th second. This is a useful one; fast enough for many of the forms of movement likely to occur in general work, and slow enough to prevent under-exposure in reasonably good light. Many photographers frequently keep their shutter on this speed, and vary their exposures by altering the stop.

A simple three-speed shutter is not likely to work at less than about  $1/40$ th of a second, whatever it may be marked. Subjects in which there is very rapid movement have to be missed. It is a great advantage to have a shutter that will give a range of automatic speeds from one second to  $1/300$ th, and such a shutter is available on cameras of quite moderate price.

The camera has no rising front. I consider this a drawback; others do not. Some of the most costly cameras have no such movement.

The camera is of "fixed focus." The result of this limitation is that no object must be included which is less than a certain distance from the lens—this distance depending on the focal

length of the lens and the stop used. Such cameras are often fitted with "magnifiers," which give a sharp image of objects at a specified distance, less than that permissible if the magnifier is not used.

The camera has "single extension." In such a case there is probably a focussing scale, and the lens can be moved to different distances accordingly. For most work the single extension is not a drawback, but it makes it impossible to focus on very close-up objects, or to photograph to natural size.

These, then, are the chief limitations likely to be met with; but it is not a fact that they all necessarily exist in any one camera simply because it is a "cheap" one. There are hundreds of second-hand "old fashioned" cameras about which have few or no such limitations. Among my small collection of cameras is one with a Zeiss  $f/6.3$  three-foci lens, fully-speeded shutter, long extension, scaled for all lenses, two finders, two spirit levels, rising and cross fronts, focussing screen, etc., etc. It is quarter-plate, but smaller than a reflex. In a fine case it cost me £5, and it works

as well as when people were willing to pay £30 for it. Compared with many modern cameras it is certainly "cheap."

But let me repeat that it is possible to make "glorious pictures" with the cheapest and simplest cameras. The trouble is to find the pictures—not the camera.

Take the two holiday snaps shown here. They, and thousands of similar ones, could be secured with a fixed-focus camera, with a single lens at  $f/11$  and a shutter speed of  $1/25$ th of a second. They do not fall short of being "pictures" for lack of expensive and complicated apparatus. The Bournemouth picture would still have been a pleasant topographical record, and nothing more, whatever camera was used. No wonderful mechanical contrivance would have brought into the sunset subject an appropriate vessel to balance the fort.

Let us recognise our limitations, but not be unduly discouraged by them. We shall get our glorious pictures, however humble our apparatus. The biggest fish are not always landed with the most expensive rods.

W. L. F. W.

## GLASS-CUTTING MADE EASY

By L. G. BENNETT.

AT the present time, when picture-framing and glass-cutting for lantern-slide cover-glasses are being attempted by the amateur, a few hints from one who has specialised in this work may be useful.

The only accessories required are an ordinary glass-cutting wheel, which can be obtained from any ironmonger for 1s. 6d., and a "guide," which may be an ordinary flat ruler, a set-square, or a steel straight-edge.

The work should be undertaken on a perfectly flat surface, and the first thing to do (an item that is generally overlooked) is to clean thoroughly the surface of the glass. This is vital, as a good "bite" cannot be obtained with the cutting-wheel on a dirty or greasy surface.

It is helpful for beginners to mark on a sheet of paper larger than the glass two lines exactly at right angles, one edge of the glass being placed on one line, and the second line being used, after measuring, as a guide for the cutter. This does away with the need of marking on the face of the glass itself.

Most amateurs hold the cutter in the same manner as an ordinary pencil, and when cutting glass apply an unnecessary amount of pressure. The correct method is shown in Fig. 1, where the cutter is held between the first and second fingers,

Fig. 1. Showing correct method of holding the glass-cutter. Note scale of measurements marked on the paper as a guide.

Fig. 2. Applying steady pressure to remove unwanted piece of glass.

with the thumb on the underside. The cutting is done with a firm, steady stroke, always towards you, keeping the screw part of the wheel on the outside, away from the straight-edge.

With too much pressure a decided scratching sound can be heard, a thing to avoid. The proper sound is a pleasant "whirr." This cut, when correctly done, forms the line of least resistance along which the glass should break when extra pressure is subsequently applied.

Having made the cut with the wheel the next step is to form a break right through the thickness of the glass. This is begun by sharply tapping the end of the cut on the underside of the glass with the metal holder of cutter. The result of this will be a crack starting at the edge of glass and continuing along the mark on the surface.

Now take a rule or straight-edge and place it under the glass in line with cut of wheel, as shown in Fig. 2. By applying pressure the unwanted piece of glass will part easily from the portion required.

With very thin glass this waste piece should come away with a twist of the fingers. Any small pieces left attached can be removed by using the notches in the holder of the cutting wheel. After one or two trials with an old piece of glass, clean and certain cutting should be no longer a mysterious job, but one quite easy for the beginner to perform.

# Picture Points

## for Beginners, by RICARDO.

### Triangle Construction

**I**N last week's series we examined the use of the triangle device as a basic structure in pictorial composition.

Although the illustrations were of still life it must be pointed out that it can be applied to almost every subject.

But the danger of following these devices too closely must be emphasized, as the picture then becomes mechanically constructed and so loses most of its spontaneity. The first sketch is an example of this fault. The pyramid construction of these figures is painfully obvious and looks too carefully posed to hold the interest for long. Not only is the triangle too tightly packed and the figures themselves too symmetrically arranged, but the yacht, which is also in the exact centre and repeats the triangular contour, makes matters worse instead of strengthening

ing the whole scheme of things.

If we compare it now with the second sketch, we can see how a re-arrangement of the figures and the yacht will improve the layout, still making use of the triangle device. Notice how the figures are now

grouped. Whenever three objects are to be shown, it is invariably better to group them as two and one instead of three separate units as shown in the first sketch, as it is more pleasing and provides variety. A trim is suggested by the vertical dotted lines.

### Vertical Balance

**I**T is difficult to say what matters most in good composition, but it seems to be the first consideration of most workers that the finished print should have its subject matter perfectly balanced.

This balance of tone values is usually associated with masses on the left and right hand sides and is called horizontal balance. If we have a subject of a simple character with no outstanding masses on either side, as shown in the illustrations, the eye becomes more conscious of the balance of the top and bottom portions.

With such a print as shown in the right-hand sketch, where the sky is just half-way down the picture, usually the result when the novice does not know how much sky or foreground to include, the true vertical balance would be to have the sky much darker in tone. Since this is undesirable and some of the foreground could well be removed, let us trim off a portion from the bottom edge. With the two tones as they now stand, we can trim off up to a point where the base appears to be just strong enough to carry the sky. This is the point of vertical balance, and it is somewhere on either side of this point that the horizontal point of balance should be, giving the one point of balance for the whole picture.

On the left is a more pleasing version of the same subject although more sky is needed in the negative and the foreground darkened to ensure good vertical balance.

### Another Constructional Device

**H**AVING seen the uses of diagonal and triangle devices for picture construction, the beginner will begin to realise that nearly all pictures can be analysed and a simple geometric shape or line be revealed as its foundation.

The device shown here of a line similar to an involute, will remind the reader of the ideal relationship between all the component parts of a picture, that they should all contribute and lead the direction of the eye towards the main point of interest. Here, again, the device must not be followed too closely, otherwise the eye is led too quickly to a climax and is consequently soon satisfied.

This device is not so useful for such subjects where the

eyecannot but help pick out the strongest point, such as dramatic action or strong tone contrasts, etc., but is intended more for such pictures which depend upon a leisurely examination to arouse the

right kind of emotion to be fully appreciated.

Two examples are shown, quite opposite in subject matter, but both of a placid character. Although it is not expected or desired that the eye shall look for the beginning of the curve and then follow it until the end is reached, it really has happened in the smallest fraction of a second, if the artist has achieved his purpose. It is only when it is analysed that the device becomes obvious, and its value appreciated.

Notice, too, that the subject matter follows the curve more closely towards the finish.

# Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

## Action Titling with Reversal Film

By  
SIGURD MOIR.

**F**REAK forms of titling come and go. They come because there is always a demand for the novel and unusual. They go because only a little experience shows them to be undignified, puerile, and more often than not out of all harmony with the film itself.

Two methods of titling remain always popular and pleasing. The first—probably the oldest form of titling—is that which makes use of plain, clear lettering upon any kind of film background. The other is of more recent origin and depends for its obvious suitability upon the use of an "action" background in complete harmony with adjacent cuts of the film proper.

This method—involving, as it does, pure cinematography—may be applied without fear of engendering freak results.

### Stock.

Although the titles can be made with either negative-positive or reversal film stock, the latter is recommended as being at once more suitable and easier of operation in amateur hands.

In brief, the method consists of selecting a suitable phase of action to be filmed as the background for each title (each being separately considered) and superimposing upon this an image of the manuscript title itself.

Naturally, the main title—being most important—should be dealt with first. The kind of action required to form the background for this is most effective when it is appropriate to the whole theme of the film. Thus, in the new and clever film, "Revolt of the Fishermen"—independent amateur production of Adriane Hanné and Michael Burke—the presentation and main titles are lettered upon background images secured in a marine aquarium. On the screen, the general effect of shadowy fish swimming in and out of the lettering is to create an atmosphere in full harmony with the rest of the film.

### Sub-titles.

Usually, a smaller range of background subjects is available for the sub-titles. Before, it was sufficient to employ any (well, almost any) background that illustrated in action form the theme of the complete film. It now becomes necessary to concentrate attention upon particular incidents referred to in the captions. Again, this point is nicely observed in the film already referred to—the storm sequence sub-titles sharing the frame with a background of wind-

lashed seascape; and, similarly, the quayside auction of the catch having as title background an apparently limitless mass of netted fish.

End-titles should, of course, preserve the harmony already established. They may, however, come in by fading into an extended shot of the final scene of the film—or they may be introduced upon a separate background representing in another way the theme of the film.

### Practical Details.

The most suitable method of filming superimposed title-matter calls for the use of a camera in which it is possible to rewind a fair length of film after the initial exposure has been made.

Where no provision exists for convenient rewinding in the camera, recourse may be had to an alternative method devised by the writer before the introduction of clutches and "against the motor" rewinds. The method consists of reserving the seven last feet or so of film on any reel for, say, three or four of the titles. This length should then be exposed on the background or

backgrounds selected for the titles, and the exposed film taken out of the camera for rewinding in a dark room.

On placing the film again into the camera, all but the reserved footage should be run off with the lens cap in position—after which the cap may be removed and the lettered titles shot off according to script.

The titles should, of course, be printed in white upon a dark velvet card—Selo or any modern printer being able to prepare a set of cards by the excellent "crush" method. It is most unwise to spoil the titles through trying to save the few shillings represented as the cost of proper printing; and some of the amazing ideas for cutting this cost can prove very expensive without yielding anything but a mediocre result.

In actual shooting, it is best to work with a light of two or four units—each, of course, of practically constant intensity.

Spacing for the titles should be carefully arranged, ultimate trimming being carried out on the return of the stock from the processing station.

*A subject such as the above makes an excellent background for titles of any film dealing with London's River and Docks.*

## Tripod-Head Troubles "ACTINOGRAPHER."

By

**L**ATEST models of a certain rather luxurious tripod are equipped with a friction-grip detachable head—which enables the camera to be engaged and disengaged with the utmost possible rapidity. Other and more familiar tripods are not so accommodating. They are equipped only with the orthodox screw top, and this—especially when exposed to location conditions and to service with a heavy metal camera—is liable to become annoyingly burred.

Occasionally, too, the screw head is somewhat longer than it should be; and there are other defects of less frequent occurrence.

### Remedies.

The main objection to an inefficient or a damaged tripod-head is that it may lead to much loss of time and, possibly, to a sacrifice of opportunities. For this

reason, detected injuries should be remedied without delay.

In the event of the brass threads becoming burred over, a watchmaker's medium file may be employed to clear the grooves, after which the camera should engage without hindrance or difficulty. Of course, a screw-cutting die of accurate "pitch" is the ideal instrument for reopening burred threads though it is not entirely necessary.

Over-long threads also may be remedied by filing, though in this case an equally satisfactory remedy may be effected by placing a packing washer over the screw head before attaching the camera.

Subsequent damage can be prevented by protecting the screw itself with a metal cap or cover. The screw-on-screw "Continental" adapters are extremely valuable in this respect—and they possess the additional advantage

of being easily obtainable at a cost of only a few pence each.

### Lubricants.

Tripod-heads incorporating panoram and tilt movements occasionally give rise to their own little difficulties. Sometimes, when the essential movements are set in aluminium bearings, appreciable stiffness is liable to be induced by atmospheric action alone.

Where the trouble has already occurred, the powdery deposit left adhering to the bearings should be removed and the friction surfaces lubricated with soft graphite or with a very few drops of lemon juice.

Burring and similar troubles are not likely to occur here—though adequate precautions must always be taken when exposing the screw threads which are part of the locking movements concerned.

By

BERNARD BROWN, B.Sc.

## Continuity by Close-ups

**M**ANY amateur films are marred by lack of sufficient close-ups, though more often than not the fault as diagnosed by critics is termed poor continuity. Few of us are likely to fall into the error of bespattering a subject with a superabundance of sub-titles, mainly perhaps because we are too lazy. So it is that during screening one so often hears the remark: "Now we're switching over to—" as the subject flickers from one scene to something entirely different and having no apparent relationship to the general theme. Nearly all troubles of this sort can be eliminated by suitable close-ups which, besides enhancing the artistic value of the picture, are easy to shoot, and for the most part can be fitted in afterwards.

Unfortunately the phrase "close-up" has become identified with the display of the charms of some star to gargantuan dimensions and the real value of the device has become submerged. For amateur work at all events it will be found that close-ups of inanimate objects and angle shots of hands and fingers will tell a far more convincing tale than a near view of the leading members of one's cast.

Looked at from one viewpoint a completed film drama or comedy represents the high-spots of a certain number of human actions. Obviously, life is

too short to show everything that went on between the start and finish of the plot. So by a process of artistic selection we emphasise the main points and arrange the continuity so that our audience take the remainder for granted. If our imagination is high-g geared we may expect more of our audience than can reasonably be expected, and obscurity results. A nice selection of close-ups will prevent the horror of a scenic hotch-potch and at the same time add charm to our productions.

Just what such close-ups are to be depends naturally upon the circumstances, but bear in mind always that they must indicate some *action*, though in some cases this may be only a change of emotion.

Suppose the wayward daughter has just quarrelled with her old-fashioned parents and to show her independence makes up strongly and rushes once more to the artificial gaiety of the night club. The two main scenes will obviously be the quarrel at home and the bubbling madness of the wicked club. Between them fit in close-ups of hands groping for lipstick, removing dance-frock from wardrobe, the pulling on of high-heeled shoes, a slammed door, and so on.

Travel from one part of the country to another is usually portrayed by the

threshing wheels of a locomotive. Not too many of us wish to risk life and limb, besides being prosecuted for the infringement of a by-law, so we may resort to other tactics. The rotating countryside as shot from the carriage window of a train serves just as well, providing we remember that there must be plenty of near-by objects to give the sensation of speed. Always shoot to the side where the telegraph poles flash by. If the journey is by road the mileage indicator of the car serves well enough, especially when amplified by a few signposts. Remember to shoot across the steering-wheel of the car, for there are still people who are not quite sure of a speedometer.

Change of emotion is a more subtle sphere for close-up work. Facial contortions and like over-acting have become quite out of date since the professional screen found its voice, and one can scarcely sub-title as "Gracie is losing her temper." Instead, she may clench her palms, tap one dainty foot on the floor, and so on. These are crude examples of what may be developed to a fine art. Try as far as possible to avoid the close-up cliché, and for the love of your art never show the passage of the year by ripping leaves from a desk calendar. There are scores of less obvious though far more effective methods.

## Ciné Catalogues and Leaflets

**E**NSIGN, LTD., 88-89, High Holborn, London, W.C.1, have just issued a new series of illustrated catalogues and leaflets covering the entire range of Ensign ciné cameras, projectors, accessories, and reels. The camera list includes all the Ensign specialities, such as the Auto-Kinecam, the Super-Kinecam, and the Ensign Simplex Pockette, and the various accessories associated with these well-known pieces of apparatus. The home ciné projector list gives particulars of the different models of the popular "Silent Sixteen" projector and the "Mickey Mouse" Home Movie Outfit. Specifi-

cations of a new screen are also given. This is the Ensign Maxflat (84 x 64) with a very ingenious device which comes into action as the screen reaches full extension, imparting an evenly distributed extra tension to the whole fabric. A new carrying-bag—the Humitin—is also a novelty for carrying twelve 100-ft. reels. Other lists include outlines of the films in the Ensign Film Library, which has now reached very extensive proportions. These lists will be sent to any reader of *The Amateur Photographer* on application, and should be obtained by all interested in amateur cinematography.

# Letters to the Editor

The Editor is not responsible for the opinions of his correspondents.

## "MINIATURE" PROS AND CONS.

SIR,—“Miniature User” in a recent issue of “The A.P.” raises a very important question for miniature camera users. The inconvenience of the 36-exposure film is always very lightly touched upon in miniature camera advertisements.

Very few amateurs would use on an average six films daily in a year, and the fact that you can take three shots of one subject does not compensate you for the thirty-three other films you must sacrifice if you require a print quickly.

May I also stress very strongly the advantages to amateurs of the reflex miniature for portraiture or pictorial work.

The “How I make my Exhibition Pictures” series has shown quite clearly that very few experts attempt serious pictorial work without a focussing screen of some kind.

When will some enterprising camera-maker build us a miniature reflex taking twelve exposures on a Leica size film?

Such a camera could be made to take up as little room as an ordinary “V.P.,” and a magnifier could be used (as in the Pilot and Rolleiflex) to ensure sharp focussing of the small picture on the viewing screen.—Yours, etc., R. H. TAYLOR.

## "CORREX" TANK DEVELOPMENT.

SIR,—In answer to Mr. A. L. Spence's question of rotating the “Correx” tank (September 4th) I overcame the difficulty very satisfactorily for Leica films.

I have a self-changing radiogram, and made a frame to fit over the pillars which support the extra records.

This has a hole in the centre, just big enough to fit over the wheel on top of the tank. A small diameter bolt through the edge of the wood round the hole just prevents the wheel slipping. The gramophone can be run to rotate the tank, and the jerking of the drum on the bottom of the tank provides just enough vertical movement.

I hope Mr. Spence will be able to adapt this to meet his needs.—Yours, etc., J. WILMOTT.

SIR,—Re A. L. Spence, letter page 239, of “The A.P.”

I also had the trouble mentioned at the end of Mr. Spence's letter in that the developer moving between the corrugations of a home-made apron caused uneven development along the edges of my Leica films.

I found this to be due to excessive movement of the tank during development, most particularly vertical movement. My present procedure is to give the “reel” (apron and film) one horizontal turn once each minute of development. I find this quite enough to ensure even development without stagnation or other troublesome patches.

I have had so many good hints from your pages that I only hope this may assist someone else.—Yours, etc.,

ERNEST C. P. COKE.

## ON ECONOMY.

SIR,—The letter of “Economicus” to Leica users on how to obtain a second-hand camera case for 2s. 6d. is distinctly amusing.

How typical is he of the school which will spoil the ship for a ha'p'orth of tar. One would forgive the owner of a cheap, unfashionable plate camera his joy in broadcasting the discovery of a cheap accessory, but a similar attempt from one of the rich men in the amateur photographic world gives birth only to ironical humour.

“Economicus” might deny his richness, might point with pride to his pen-name, but the fact remains that on his own admission he is the possessor of a Leica No. I, an Elmar 35-mm. wide-angle lens, a 10.5-cm. long-focus lens, an Ombrux exposure meter, three filters, two lens hoods and a Balda range-finder—an outfit for which a low estimate is £35. It seems that a man who is willing to spend such a sum does not justify his pen-name of “Economicus,” and that his attempt to obtain a camera case for 2s. 6d. demands a much harsher name.

As a further irony it appears our “miniaturist” requires a case 6×5×4 in., which latter are roughly the dimensions of a half-plate camera. This confirms a long-felt suspicion that the “miniature” of “miniature photography” refers to the size of the film only.—Yours, etc., VINCENT HILL.

# THE WEEK'S MEETINGS

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

S. Suburban and C.P.S. Lecturettes by Members.  
Worcestershire C.C. “Lantern Slide Making.” Fred. Green.

# Readers' Questions ANSWERED

**GENERAL.**—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

**CONTRIBUTIONS.**—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

**ENQUIRIES AND CRITICISM.**—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a separate stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

## Dry-Mounting Temperatures.

What is the correct temperature for the iron to be when dry-mounting tissue is used?

W. A. (London.)

About 200° F. is the best temperature. As it is difficult to measure the temperature when an ordinary flat-iron is used, it is a good plan to keep the iron in a pan of boiling water between intervals of use, wiping the iron dry before applying it. When a proper dry-mounting press is used, a thermometer is usually fitted to check the temperature.

## Diffusion in Enlarging.

I have tried using chiffon on my bromide papers during enlarging, but cannot get a satisfactory diffusion effect. Where should the chiffon go, and has the colour of this material any effect on the diffusion?

C. C. (Forest Gate.)

Although some workers prefer to hold their chiffon diffusing sheets at various distances between the paper and lens, a more constant effect is to be obtained by placing the chiffon over the lens itself, holding it in place by a rubber band. Further diffusion can be obtained by additional layers of chiffon. As far as the colour of the material is concerned, it will be found that white chiffon will tend to give more diffusion than the black or dark tinted colours.

## Correcting Verticals.

What is the best method of correcting verticals while enlarging? Is it necessary to tilt both negative and easel, or is it just as satisfactory to tilt the easel only?

C. D. (London.)

It is better to tilt both the negative and the enlarging easel in opposite directions, although the tilt of either the one or the other will answer also. If the easel is tilted from a middle point, this will be the correct spot for focussing. The lens is then stopped down until the definition is satisfactory at the top and bottom edges of the print.

## Chromium Intensification.

What is the cause of the badly-stained and poor colour of the enclosed negative? It has been intensified by the chromium method.

D. E. (Birmingham.)

The negative you send has not been properly redeveloped, or the image would be black instead of such a weak brownish colour. We cannot offer any explanation of this surface stain on the negative, which gives it very much the appearance of an old and stale plate. It is very probable that the whole of the stain would disappear on rubbing with a piece of rag and a little of Baskett's reducer. If methylated spirit is used instead of the reducer this should also answer, but it is no good merely soaking the negative in the spirit.

## Glazing Prints.

Can you tell me the quickest method of drying and glazing prints on a ferrotype sheet? Should I use plain or acid hypo for fixing?

W. G. J. (Blaenavon.)

Give the prints two or three minutes in a 10 per cent solution of formalin and transfer them straight to the ferrotype plate. A reasonable amount of heat can then be used to dry them without the gelatine softening. There is no real need to use anything but a plain hypo solution for either negatives or prints, but an acid hypo solution is generally preferred, and is quite easily prepared.

## Over-exposed Negatives.

Is it better to print right out an over-exposed negative and then copy the print rather than reduce the negative? I find that reducing by the persulphate method gives the wrong tone values.

V. L. (Glasgow.)

We cannot give a general answer to the question you put. The purpose of using persulphate as a reducer is definitely to alter the contrasts, as it affects the denser parts more in proportion than the weaker ones, and it does not at all

follow that an over-exposed negative is too contrasty; it is more likely to be the reverse. It is quite possible that an over-exposed and not fully developed negative might require clearing with Howard Farmer reducer and then intensifying, but, as we say, we cannot lay down any general rule.

## Viscose Sponges.

Can you tell me if there is an artificial silk sponge on the market for wiping wet negatives?

C. S. (Birmingham.)

An artificial silk sponge is made by Agfa, Ltd., under the name of Viscose sponge, and is distributed by Sands Hunter & Co., Ltd., 37, Bedford Street, Strand, London, W.C.2.

## Colour Sensitivity.

What is the essential difference between orthochromatic and panchromatic emulsions, and their respective colour filters?

A. P. (Cornwall.)

An orthochromatic emulsion is more sensitive to yellows and greens than an ordinary, but is not sensitive towards the red end of the spectrum. A panchromatic emulsion is sensitive into the reds. Both kinds of emulsion are, however, over-sensitive to the blue and violet rays, and it is to damp these down that a filter is used. It is the question of the use of colour filters that is complicated, but you can get a good idea of the subject by reading a little book called "Panchromatism," published by Messrs. Ilford Ltd., price 6d., or by post 8d. We think you would find this very useful.

## High and Low Key Tones.

Will you kindly explain the terms of high key and low key and how they are obtained in photographic prints?

G. D. (Parsons Green.)

A high-key print is one in which most of the tones are very light, comprising only a range of greys. In a low-key print, however, the tones are mainly rich and dark, probably with considerable black included. The question of the methods of obtaining such results cannot be dealt with adequately within the limits of a short reply.

## Tarnished Prints.

What is the safest way of removing a curious opalescent coating over some old prints which I believe to be sepia-toned bromides?

S. H. M. (Lymington.)

We should advise you to take a piece of rag or a wad of cotton-wool, moisten it with methylated spirit and rub the surface of the print. If this does not answer the only alternative we can recommend is to substitute Baskett's reducer for the methylated spirit. We hope that the first will answer, as the second is something that really requires making up to a formula.

## Hardening Emulsions.

Can you give me a method of hardening plates and films before development, so that I can continue in solutions of 80 to 100 degrees Fahr.?

S. H. (Woolwich.)

Although films and plates can be hardened in a 10 per cent solution of formalin and then washed and developed, we do not recommend this process. It is generally, even at high temperatures, quite safe to develop the negative and then transfer it to a hardening, fixing bath.

# ZEISS

PHOTOGRAPHIC LENSES—apart from their unques-  
tionable superiority of design—are manufactured under such  
ideal conditions that

#### The BEST DEFINITION

is assured for each and every lens which succeeds in passing  
the stringent tests of the ZEISS factory.

#### For MINIATURE CAMERAS

the UTMOST PERFECTION of definition is a *sine qua non*, and  
neglect to insist on a ZEISS lens is undoubtedly responsible for  
many failures and much disappointment to owners of miniature  
cameras.

Write for List P.51, and details of the best lens for

YOUR camera, to **CARL ZEISS (LONDON) LTD.**  
37-41, Mortimer St., London, W.1

# The Amateur's Emporium

## Prepaid Advertisements

### SALE AND EXCHANGE : AMATEURS ONLY—

12 words or less.....1/-  
1d. for every additional word.

### PROFESSIONAL AND TRADE—

12 words or less.....2/6  
21d. for every additional word.

Each paragraph is charged separately.

**SERIES DISCOUNTS** are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue : 13 consecutive insertions, 5% ; 26 consecutive, 10% ; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid, and reach the offices, Dorset House, Stamford Street, S.E.1, not later than first post Friday for the following week's issue. Advertisements are inserted, as far as possible, in the order received, and those received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

## Box No. Advertisers

If a Box No. is required the words "Box 000, c/o 'The Amateur Photographer'" should be included in the charge, and an additional 6d. sent for registration and cost of forwarding any replies.

Letters addressed to box numbers are simply forwarded by us to the advertisers. We do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisements.

## Deposit System

Readers may deal in safety through our Deposit System. Purchase money should be deposited with "The Amateur Photographer and Cinematographer." The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods, they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit. For transactions up to £10 a deposit fee of 1/- is charged; over £10 and under £50, 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; over £100 one-half per cent. All correspondence must be sent to Dorset House, Stamford Street, London, S.E.1.

"The Amateur Photographer" can be obtained abroad from the following : **UNITED STATES** : The International News Co., New York. **FRANCE** : W. H. Smith and Son, 248, Rue Rivoli, Paris; Hachette et Cie, Rue Reaumur, Paris. **BELGIUM** : W. H. Smith & Son, 71-75, Boulevard Adolphe Max, Brussels. **AUSTRALIA** : Gordon & Gotch, Ltd., Melbourne (Victoria), Sydney (N.S.W.), Brisbane (Queensland), Adelaide (S.A.), Perth (W.A.), and Launceston (Tasmania). **NEW ZEALAND** : Gordon & Gotch, Ltd., Wellington, Auckland, Christchurch and Dunedin. **INDIA** : A. H. Wheeler & Co., Bombay, Allahabad and Calcutta. **CANADA** : Imperial News Co., Toronto, Winnipeg and Vancouver; Benjamin News Co., Montreal; Gordon & Gotch, Ltd., Toronto. **SOUTH AFRICA** : Central News Agency, Ltd.

Cheques and Postal Orders sent in payment for deposits or advertisements should be made payable to **ILIFFE AND SONS LTD., and crossed**

Notes being untraceable if lost in transit should not be sent as remittances.

## CAMERAS AND LENSES

**1-PLATE** Soho Reflex, f/4.5 Zeiss Tessar lens, 4 2 doz. single, 3 double slides, also Wishart adapter and 12 envelopes, £12, or nearest; exceptional condition.—Lindner, Ravensgate, Charlton Lane, Cheltenham. [9630]

**31**×21 T.-P. Reflex, revolving back, f/4.5, F.P.A.; 34 good condition, £4.—Howes, 49, Paulet Rd., Camberwell, S.E.5. [9688]

**FOLDING** Reflex Camera, 9×12 cm. plate, Ernemann f/6.8 anastigmat, speeds 1 to 1/300th sec., rising front, double ex., focussing screen, cable release, 3 slides; perfect condition; reasonable offer.—Box 5527, c/o "The Amateur Photographer." [9696]

## WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

## CAMERAS AND LENSES

**SOHO** Reflex, 3½×2½, 4½-in. f/4.5 Ross Xpres, revolving back, 3 D.D. slides, F.P.A., hide case, 1935 model; perfect, little used; cost £35; £17/10.—Box 5528, c/o "The Amateur Photographer." [9697]

**LEICA** III for sale, Summar f/2 collapsible, both chromium plated, in ever-ready case; brand new condition, as can be stated by makers.—Salomon, 114, Gower St., W.C.1. [9698]

**31**×21 Goerz Tenax Folding Roll Film Camera, f/6.3 Tenastigmat in Compur, 1 to 1/250th sec.; cost £8/9/6; £5/10.—Graham, 5, Alexandra Place, Annan. [9699]

**1-PLATE** Thornton-Pickard Ruby de luxe Reflex, Cooke f/2.5 Dallmeyer Popular Telephoto f/6, with hood, case and flange, 5 D.D. slides, F.P.A., focussing screen, leather case; all perfect and as new; listed £55; what offers?—Below.

**31**×21 Zeiss Donata, Tessar f/4.5, D.A. 32 Compur, 1 to 1/250th sec., rising and cross, double extension, brilliant and direct view-finders, focussing screen, F.P.A., R.F.H., leather case; all perfect; as new; listed £16; what offers?—Thomas, Tredegar, South St., Leominster. [9700]

**1-PLATE** Marion Soho Reflex Camera, tropical 4 model, with or without lens, complete with F.P.A. and 24 Mackenzie-Wishart slides, leather case; cost £58; all in perfect condition, and as new; complete outfit, £20.—T. W. Wilkinson, Lochinvar, Moss Lane, Ormskirk. Phone 289. [9702]

**EXAKTA** Vest Pocket Size Reflex, Zeiss Tessar lens f/3.5, focal-plane shutter, speeds 1/25th to 1/1,000th, perfect condition; listed £19; bargain, £10.—Box 5570, c/o "The Amateur Photographer." [9704]

**EXAKTA** Model B, Tessar f/3.5, Zeiss filter, leather case; new condition; cost £23/10; sacrifice £13/10.—Box 5571, c/o "The Amateur Photographer." [9705]

**V.P.** Zeiss Roll Film, Tessar f/4.5, Compur 1/300th sec.; perfect condition, £5/10.—Reeves, 8, Greenbank Drive, Liverpool, 17. [9708]

**LEICA** III, f/3.5, chromium plated, in case; unused; £24; also accessories.—Box 5572, c/o "The Amateur Photographer." [9710]

**ROLLEIFLEX** 2½×2½, Zeiss Tessar f/4.5, Compur shutter, 1 to 1/300th, non-automatic, leather case, £7; condition perfect.—Jackson, 32, Westwell Rd., London, S.W.16. [9711]

**£7/10** Kodak Retina, ×2½ filter, 2 Leitz cassettes, sling case, zip purse; perfect condition; deposit system preferred.—Bailey, 1, College Fields, Bristol, 8. [9716]

**£4** Orion 3½×4½ Plate, double extension, rise and cross, Meyer-Goerlitz lens f/4.5, Compur shutter, leather case, 8 slides; good condition.—Write, Enssner, 4, Aberfoyle Rd., Streatham. [9721]

**T.-P.** Special Ruby Reflex, 3½×2½, Cooke f/3.5 lens in sunk and reversible mount, 3 double plate-holders, F.P.A., Ilford filters with mount, black leather case; perfect condition; bargain, £10.—Sutton, 84, Sandbourne Avenue, Merton Park, S.W.19. [9723]

**SUPERFECTA**, Tessar f/3.8, used twice, case; list price £28/10; nearest to £24.—Moore, 5a, Arundel Terrace, Brighton. [9724]

**NO. 1** Ensignette, f/7.7 Luxor anastigmat lens; good condition, £1.—27, Waterloo St., Devonport. [9727]

## CAMERAS AND LENSES

**LATEST** Agfa Speedex O, used twice, f/3.9, L Compur, case; cost £5/10; bargain, £3.—6, Glendall St., Ferndale Rd., Brixton. [9728]

**31**×4½ Miroflex, Tessar f/4.5, F.P.A., slides, carrying case, colour filters; as new; nearest £25; list price £60.—Pierce, 2, Oak Villas, Hurstpierpoint. [9729]

**A** MATEUR has for sale very comprehensive photographic outfit including:—

**1-PLATE** Miroflex, Zeiss Tessar f/4.5; ½-pl. T.-P. Duplex Reflex, f/2.5 Cooke lens; 3½×2½ Nettel Press, f/4.5 Zeiss Tessar; 5×4 Goerz Press, f/4.5 Goerz lens; 5×4 T.-P. Press, f/4.5 Tessar; also several useful accessories; above can be seen by appointment.—J. L. Balmforth, Rydal Mount, Ruff Lane, Ormskirk. [9732]

## ENLARGE FROM THOSE TINY NEGATIVES with a

### "PRAXIDOS" VERTICAL ENLARGER

The Praxidos opens up a new world of interest and enjoyment. There are two models—NON-AUTOMATIC and AUTOMATIC. With the latter the image is ALWAYS IN FOCUS, irrespective of the size of the enlargement being made.

Praxidos enlargers were specially designed for making enlargements simply and efficiently from miniature negatives such as Leica, Contax, Brilliant, Rolleiflex, Rolleicord, Super Ikonta, etc., whilst there is the  $3\frac{1}{2} \times 2\frac{1}{2}$  size which will take negatives of this size or less, and parts of larger negatives up to  $9 \times 12$  cm.

The Praxidos takes 100-watt opal lamp, can be used with or without a condenser—which may be single or double, according to the kind of enlargement required—and permits EXCEPTIONALLY SHORT EXPOSURES.

Needle-sharp enlarging is as simple as contact printing with the Praxidos.

Send for new prospectus, which gives full particulars and prices, to:

**SANDS HUNTER & CO., LTD.**  
37, BEDFORD ST., STRAND, W.C.2

Non-Automatic Praxidos with Tall Lamp house for use with Double Condenser.

Automatic Praxidos with Short Lamp house for use with opal diffuser.

## WHAT BECOMES OF THE NON-MINIATURES?

As is generally known, the firm of R. G. Lewis deals exclusively in miniature cameras. In the ordinary way the non-miniatures which we take in part exchange for these are immediately passed on to the trade. We have, however, during the last twelve months acquired a small selection of really exceptional outfits which we are offering for sale below.

The following eight cameras are 1935 models of the very latest type. They are in each case absolutely indistinguishable in any way from brand new. Several are actually unused, and with each camera we give a written guarantee of mechanical and optical perfection.

1935 LATEST 1-plate Soho Reflex, f/3.5 Ross Xpres lens, 2 filters, 2 special lens hoods, fitted Soho slow-speeds release,  $\frac{1}{2}$  to 3 sec., 3 double slides, F.P. adapter, silk changing-bag, pigskin case. Cost over £53. AS BRAND NEW...£25 0 0

1935 LATEST Unused  $1\frac{1}{2} \times 2\frac{1}{2}$  Soho Dainty Reflex, f/4.5 Ross Xpres, 11-in. f/5.6 Dallan Telephoto, 2 F.P. adapters, Riteway film holder, focussing magnifiers, antinuous release, 3 filters, best hide case. Cost £56 14s. 6d. AS BRAND NEW...£25 0 0

1935 LATEST 1-pl. T.-P. Junior Special Reflex, fitted with swinging front, f/4.5 Ross Xpres, 3 slides, F.P. adapter, focussing magnifiers, best leather case. Cost £21 10s. AS BRAND NEW £10 0 0

1935 LATEST  $3\frac{1}{2} \times 2\frac{1}{2}$  Ensign Special Reflex, f/4.5 Ross Xpres lens, 3 slides, F.P. adapter, roll-film holder, 2 filters, magnifiers, leather case. Cost £21. AS BRAND NEW...£10 0 0

1935 LATEST Ensign Speed Film Reflex, f/3.4 Aldis-Butcher lens, direct-vision finder, leather case. Cost £12 13s. 6d. AS BRAND NEW...£6 0 0

1935 LATEST 4-pl. Ihagee Sports and Press Camera, self-capping focal-plane shutter,  $\frac{1}{15}$ th to  $\frac{1}{1,000}$ th sec., f/3.5 Zeiss Tessar, F.P. adapter, leather case. Cost £47. AS BRAND NEW...£18 17 6

1935 LATEST 551/17 Zeiss Ikon Nixe, double extension, 4-pl. camera, for roll films or plates, f/4.5 Tessar, D.A. Compur, case. Cost £22 12s. 6d. AS BRAND NEW...£12 0 0

1935 LATEST  $3\frac{1}{2} \times 2\frac{1}{2}$  Etui, Model II, double extension, f/4.5 Tessar, D.A. Compur, F.P. adapter, roll-film holder. Cost £16 5s. AS BRAND NEW £8 0 0

The following cameras are older models, but in really magnificent condition and fully guaranteed.

$3\frac{1}{2} \times 2\frac{1}{2}$  T.-P. Special Ruby Reflex, f/4.5 Cooke lens, 3 slides, F.P. adapter and case. All practically unsoiled...£5 0 0

$3\frac{1}{2} \times 2\frac{1}{2}$  N. & G. Folding Reflex, Ross Xpres f/4.5, 11-in. Dallan f/5.6 Telephoto, 3 D.D. slides, F.P. adapter, leather case...£27 10 0

$3\frac{1}{2} \times 2\frac{1}{2}$  N. & G. Special Folding Reflex, f/2.9 Dallmeyer Pentac, 6 double slides in special holder, F.P. adapter, 3 filters, copying lens attachment, leather case. In exceptional condition...£25 0 0

Zeiss Ikon Nixe 551/17, 4-pl. Camera, for films or plates, f/4.5 Tessar, D.A. Compur, focussing screen. New condition. Cost £22 12s. 6d. £11 0 0

Zeiss Ikon Iclette, double extension model, 551/2U, f/4.5 Tessar, delayed-action Compur, focussing screen, 4 slides and F.P. adapter. Cost £18. In new condition...£9 10 0

Zeiss Ikon Ideal  $9 \times 12$  cm., f/4.5 Tessar, old type Compur, 6 slides, F.P. adapter, case...£7 0 0

Ica Postcard size Roll Film Camera, old type Compur, f/4.5 Tessar, case...£5 0 0

V.P. Zeiss Nettel Speed Camera, f/2.7 Tessar, focal-plane shutter,  $\frac{1}{10}$ th to  $\frac{1}{500}$ th sec., 6 slides, F.P. adapter, case...£10 0 0

## LIGHT FILTERS

OPTOCHROM Filters are made of optical glass coloured throughout its entire mass during manufacture. They are not, therefore, affected by heat or damp, as are gelatine filters mounted between glass.

OPTOCHROM Yellow Glass Filters are for use with Orthochromatic Plates or Films.

OPTOCHROM Universal Green Glass Filters are for use with Panchromatic material. Exposure factor  $1\frac{1}{2}$  to 2.

OPTOCHROM Blue Glass Filters, for artificial light exposures with Panchromatic material. Exposure factor  $1\frac{1}{2}$  to 2.

OPTOCHROM Red Glass Filters are recommended when extreme contrast is required from Panchromatic plates or films, also for Infra-red emulsions. Exposure factor 6 to 10. Infra-red 30 times.

Set of 4 filters to fit Contax lens, diameter of filter mount 27 mm., complete in velvet-lined leather case

£2 0 0

To fit Contax lens, 42-mm. diameter

# EXHIBITION PRINTS

DEVELOPED WITH

## "FESAGOL N"

Which automatically compensates for errors in exposure,

**WILL BE PERFECT**

**With "FESAGOL N" exposure is almost unimportant**

"The Amateur Photographer" says:—

"Remarkable latitude in exposure and development without staining for prolonged development or poor colour for shortened development."

"Only difference between full and barely adequate exposures was the length of time in development. The final results in each case being excellent."

**YOU WILL GET PERFECT RESULTS AND NO WASTED PRINTS**

To make 90 oz. **3/2**

Obtainable from all Dealers

Send for descriptive leaflets to:

**L. A. LEIGH**  
BALFOUR HOUSE

119/125, Finsbury Pavement, London, E.C.2

**WRITE FOR FREE LISTS**

enclosing 2d. stamp for postage.

As advertisements on these covers go to press a fortnight in advance some of these second-hand items may be sold already, but similar outfits are usually available.

**FOREMOST LEICA SERVICE**

Come to the firm with over ten years' Leica experience, and have your needs filled with speed and exactitude. We have every Leica camera, lens and accessory in stock and offer facilities to registered Leica customers which cannot be obtained anywhere else. Special binders are supplied at 1s. to preserve your copies of "Leica News." Transit envelopes are given free, so that your Leica spoils may travel with safety through the post. Leica exposure record cards are also available, and free technical information is given on all matters photographic.

**ZODEL LENS HOOD**

It is not only in the summer that the Zodel lens hood is indispensable. In autumn photography, with the sun at a lower altitude and giving many beautiful shadow patterns and against-the-light effects, a lens hood is even more necessary. Good shots, too, can be obtained on wet days with the aid of a Zodel lens hood—in fact, the scope of your photography is widened considerably during the autumn and winter months. Zodel lens hood is telescopic and folds flat for carrying. It is easily fitted to almost any camera. State size of lens when ordering. **ONLY 7/6**

**ZEISS IKON MAGNIPHOT**

For enlargements from miniature negatives (1 1/2 x 1 in.) and other cameras using the 1 1/2 x 1 in. size. Enlarging ratio is 3 to 30 diameters. Focussing is not automatic, but is performed by focussing mount. Give pictures up to 15 x 10. With lamp and mask for 24 x 36 mm. negatives. **£10:0:0**

Nine monthly payments of 22/4.

**LEICA 'FOCOMAT'**

Has automatic focussing, and enables you to make perfect pictures up to any size from 3 1/2 x 2 1/2 to 15 x 10 in. Diffused illumination gives soft, harmonious enlargements.

For use with your own Leica lens. .... **£16:6:6**

Nine monthly payments of 38/2.

## A Rolleiflex PICTURE

Is YOUR "bill" big? If so you need a Rolleiflex—the most economical high-class camera on the market. Not only does it take 12 pictures on a shilling roll film, but it shows you exactly what to take and what not to take, and so prevents you wasting film on mediocre pictures. The ease of dead-accurate focussing and the remarkable facility for composing perfect pictures, makes Rolleiflex a master camera in the hands of the amateur. Fitted with Zeiss Tessar F/3.5 lens and one-lever Compur shutter speeded to 1/500th sec., T, and B. The plate back and numerous other accessories equip Rolleiflex for the widest possible range of photography. £22 10 0.

See it at your dealers.

# The A.B.C of Home Snapshots After Dark

**A.** Put some Kodak Super Sensitive Panchromatic Film into your camera.

**B.** Plug-in a "Photoflood" or two in place of the ordinary electric light bulbs.

**C.** If you want to make the most of the light from your "Photoflood" use a "Kodaflector" Reflector.

How this picture was made. Two "Photofloods" in "Kodaflectors" were used. The exposure was  $1/25$ th sec. at  $f5.6$  on Kodak Super Sensitive Panchromatic Film.

**Kodak Super Sensitive Panchromatic Film.** The film of lightning speed; especially sensitive to artificial light. Made in roll film and film pack.

**"Photoflood" Lamp.** Special type of electric bulb that gives powerful, highly-actinic light. New reduced price, **2/6.**

**"Kodaflector" Reflector.** A collapsible, specially-surfaced aluminium reflector that concentrates the light from the "Photoflood" and considerably shortens necessary exposures. It fits on to any electric lamp holder. **3/-**

For details of other Kodak Night Photography Aids, including the "Sashalite," and examples of night-time pictures with explanatory diagrams, ask your Kodak Dealer for free illustrated Night Photography Folder.

## MINIATURE CAMERA BARGAINS AT LOWER PRICES

### SPECIALIZATION.

#### MINIATURE APPARATUS.

We are the only firm in Great Britain specializing exclusively in miniature apparatus such as the Leica and Contax. Every miniature camera of distinction together with a full range of accessories is to be seen at our showrooms. Where miniature cameras are concerned, we give the highest part-exchange allowances and pay the best cash prices in the trade.

#### PROCESSING.

A new approach to the problem of processing is essential if flawless negatives and perfect enlargements are to be produced from miniature negatives. Appreciating this, we have equipped ourselves exclusively to deal with the miniature negative. We pride ourselves that the results fully justify our policy.

### Coming—THE CONTAFLEX!

## *Practically Unlimited Uses with the* **CONTAX**

The Contax has been designed with one end in view—the production of the perfect miniature negative. This end is attained by the microscopic definition given by the Zeiss lenses; by the exactness of the focussing permitted by the use of the long base patent rotating wedge distance meter; by the extraordinarily fine limits to which the whole of the mechanical work contained in the camera is worked; and the fineness of the grain of the modern film, in which connection the Zeiss Ikon Pernox is an outstanding example. The metal focal-plane shutter permitting exposure to a real  $1/1,000$ th second, and the wide range of Zeiss lenses place within the power of the Contax owner practically all branches of photography.

The handsome rectangular shape of the Contax makes it easy to hold steady, and the back of the camera is detachable for cleaning (an important point, because dust and particles of film emulsion will collect inside a camera and must be removed, otherwise negatives will suffer from pinholes) besides providing for the use of a ground-glass screen and slides for single exposures. It is even impossible to make, inadvertently, a double exposure with the Contax, because the act of winding the shutter automatically winds on the film.

The above photograph is an example of Contax stage photography. It is taken with ordinary lighting of the stage, without any auxiliary illumination.

The Story of the Contax and its lenses are contained in our books, "The Connoisseur and the Contax," and "The Ten Contax Lenses," both of which will be sent free on application.

The Contax can be obtained from most high-class camera dealers on the instalment system, name and address of nearest dealer on request.

VOL. LXXX. No. 2449.

THE closing date for "The A.P." Annual Lantern-Slide Competition is drawing near. All packages containing entries should be in our hands by the last day of the month—Thursday, 31st. There can be no extension of this date as the slides will have to be unpacked, classified and judged without delay to permit of the prize set starting on its long tour in the second week of November. In addition to the conditions of entry that have been published every week, we would like to draw attention to one other point in the interests of the competitors themselves. It is: pay special attention to the careful packing of the slides before trusting them to the tender mercies of the post. Every year a considerable number of slides for this competition arrive broken—due in every case to faulty packing. A glass lantern slide is a fragile thing, and should be treated accordingly. Corrugated paper is cheap, and lots of it rolled round the box of slides—in two directions—will generally render the contents immune from breakage.

### Quick Dispatch.

Was ever anything so quick and busy as the Business Efficiency Exhibition at Shepherd's Bush? There are so many labour-saving devices that one begins to feel there can be no more labour to save. It was a little disappointing, therefore, to search carefully and find no adaptation of photography to office use. There is everything here that makes for mechanical ease and precision. Everything is duplicated, triplicated, manifolded; the telephone and dictaphone and every other kind of phone are at your service in all sorts of ingenious ways,

## TOPICS of the Week

LONDON LANDSCAPES (No. 38).

*An autumn afternoon on the Serpentine,  
Hyde Park.*

and there are card indexing, and mechanical accountancy, and goodness knows what. Yet apparently among these modern methods no employment has been found for photography, which is one of the neatest and most accurate duplicating methods going. Of course, so far as advertising is concerned, it is everywhere. Every stand bore testimony to it, either in the shape of enlargements on the wall or reproductions in the catalogue. Sometimes very ingenious uses had been made of photography, too. We like the man who brought in examples of Zoo photography, putting up, for instance, an exasperated look on the face of a lion, and under it, "Yes, but he hadn't used the — telephone attachment."

### Votive Offerings.

Mr. Arthur Pereira, who has been taking his camera, principally to get Dufaycolor pictures, into the islands of the South Seas, told his exhibition audience at the "Royal" the other night of his experience on the way there in Rangoon. There he visited the famous pagoda, and the great staircase up which everyone, the tourist photographer as well as the devout pilgrim, must go barefoot. These lead to where the images of Buddha gaze impassively at all the visitors alike. They also lead to the spot where the faithful cast their treasures—their jewels and their gold. And here, among the bracelets and the pendants and the turban ornaments and the massive earrings, Mr. Pereira noticed—some thirty-shilling cameras! One wonders what impelled the tourists to cast aside their chosen instruments. Was it also in an ecstasy of devotion, or was it in an extreme of impatience? Was it a

gesture signifying the attainment of Nirvana, the extinction of all desire, the emancipation of the spirit from all ambitions, even the innocent—or relatively innocent—one of making photographic records? And what did Buddha think of this offering? Here indeed was the West—for the cameras, we believe, were of American make—prostrate at the feet of the East.

### Photographing the Stars.

A well-known physicist in the States, Professor R. H. Goddard, of Clark University, Massachusetts, obtained leave of absence from his university as far back as 1930 and went into the desert of New Mexico, called in America the "sunshine State," to devote himself to perfecting a rocket method of reaching extreme altitudes. We now learn that Professor Goddard has perfected a giant rocket which travels at 700 miles an hour, and has been trained to photograph stars and come down to earth again, bearing the latent image for terrestrial development. Seven hundred miles an hour is pretty good going, even

to this speed-bitten generation, but, even so, at that rate it would take a fortnight non-stop to reach the moon, and, of course, a fortnight to come back, while as for the nearest star, other than the sun of course, to get a close-up of that would mean a journey of some unimaginable thousands of years, and by the time of the rocket's return the human race might have forgotten how to develop such prehistoric plates. But, in fact, the role of the rocket camera is not so ambitious. It is to go up for fifty miles into the stratosphere, and who can tell what panoramas of the heavens it may bring back once it is clear of the earth's atmosphere? Good luck to it!

### All Sharp.

The name of Jack Sussman keeps recurring in the news from the "other side" in connection with what is described as a "revolution in photography"—about the ten thousandth revolution in photography within living memory. Jack is a little man of forty, who was born in Russia, came to America in 1904, and has been for twenty-

five years gathering news events in every state. We are told that he even ran away from school at Brooklyn because he was more interested in cameras than in lessons. Unlike most Press photographers, he went into the optics of the thing, and the mathematics of it, and even mastered the technique of lens grinding. The result was seen, the other day, in New York City, when he demonstrated a new lens which gives a remarkable illusion of depth, making a three-dimensional photography possible. In perfecting his lens many months of work were necessary to get rid of edge-distortion. Now the lens says goodbye to all the limitations of ordinary lenses, whereby, if the foreground is sharp, the background is blurred. With Jack Sussman's lens, foreground, background, and middle distance are all equally sharp, so that, says an enthusiastic commentator, a tall chimney a mile away is as sharply photographed as the grin on the face of the urchin just underneath the camera. The Sussman system aims at introducing new possibilities into ciné work.

## READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with on this page week by week. Other replies appear as usual on the last page.

### Photographic "Periods."

*In view of growing interest in Daguerreotypes I should like to have some rough idea of the "periods" of the earlier processes, just as we have "periods" in architecture. Can you give me a few points on the matter?*  
R. A. R. (Bristol.)

Architectural periods, approximately dating the "styles," were long; photographic periods, dating the chief "processes," were short. In both cases, however, there was considerable overlapping, and the periods are not sharply limited and defined.

Daguerre had made considerable progress with his method by 1837, and it was fully described and published in 1839. In 1840 it was found that the speed of his plates could be enormously increased by the addition of bromine to the iodine previously used, and from this year onwards the process was in vogue for professional portraiture.

As early photographs are often erroneously described as daguerreotypes, it should be understood that the name applies only to positive pictures on a copper plate with a polished silver surface. No photograph on glass or other base can be a daguerreotype.

Fox Talbot was getting photographs of a sort in 1835, and published details of his process, and exhibited specimen results in 1839. His Calotype process was being employed at the same time as Daguerre's process from 1840 right into the early fifties. The death-knell of both was rung by the introduction of the wet-collodion process in 1851. Plates for this work were sensitised with a nitrate of silver bath, and had to be exposed while still wet.

It had been discovered as early as 1839 that gelatine sensitised with potassium bichromate became more or less insoluble

in proportion to light action. Although this is not a "period" it is an important date, as the discovery mentioned led to the perfection at various times of many valuable processes—carbon, collotype, oil, gum, photogravure, etc.

By 1864 it was possible to use dry-collodion plates, which were obviously much more convenient than the wet plates. But by 1880 these had been superseded by gelatine dry plates, fundamentally the same as those in use to-day. The same sorts of emulsions were afterwards coated on to paper and to celluloid, as well as on to glass.

When it comes to printing processes it is, of course, possible to name dates for their introduction, but the list would be a long one. Within the comparatively short photographic era (roughly a century) some of these have not only been born, but have died out.

In colour photography such processes as those of Lippmann and Ives were followed by the important Lumière method (about 1904). This comparatively recent date may be taken as the beginning of practical colour work, now making rapid strides, especially in the realm of cinematography.

Also involved in the chronological history of photography are the innumerable introductions, improvements and developments in apparatus (mechanical and optical), accessories, chemicals, materials, etc. There must be remembered the beginnings of telephotography, microphotography, X-ray work, phototelegraphy, etc., etc.

It is evident that in photography these cannot be said to be "periods" as in architecture and other arts; but every year for the last century has made some (generally many) contributions to photography in its many forms. The bare enumeration of these would fill a large volume.

# WORK for the *Longer Evenings*

One of the greatest advantages of photography as a

hobby is that it provides interesting recreation for all times and seasons, even to those possessing the most modest of apparatus. Long evenings can be occupied by the amateur in many photographic ways besides using the camera itself, as indicated in the following article.

IT is safe to say that most amateurs at the commencement of the indoor season find themselves with a large stock of negatives taken during the lighter months, many of them unprinted, and still others almost unprintable, while yet others have been regarded as just passable records and no attempt has been made to produce good prints from them.

One of the first tasks, therefore, is to print from the good negatives at least small prints and to put these right away into an album. Never mind if they are pictorial or not; it is quite sufficient if they give a happy record, or even just recall an event in the past, and if they are horrors of bad composition—well, they may prove warning signs for work in the future!

## **Indifferent Negatives.**

Other negatives should be sorted into their respective classes. Thus those suffering from over-exposure—and these are becoming more numerous since the days of fast films—should be placed on one side for reduction, while those which are so thin as to produce only a dull, flat print may be put in another group for intensification.

It must be remembered that neither intensification nor reduction will produce the kind of negative that is equal to one correctly exposed and developed; but these processes often enable quite a good print to be obtained in the place of an indifferent specimen. It should also be remembered that in the case of reducing, few reducing agents work evenly, and therefore there is liable to be a change in tone values; while in intensification it is useless to try to improve a negative which already has little or no image impressed thereon. Negatives with large patches of clear glass or

celluloid will not print into nicely graded pictures no matter what you do to them, and usually these are best consigned to the dustbin.

## **Reducing.**

Two or three methods of reduction can be applied, according to the amount of reduction needed. The easiest method is by rubbing the negative with clean pads of cotton-wool dipped in Baskett's reducer, which is very simply made up by mixing 2 oz. of terebene, 2 oz. of olive oil and 2 oz. of Globe metal polish well together and then carefully straining the mixture. If Globe polish is unobtainable other metal polishes may be tried, but this is certainly the best for the purpose. It will be observed that after a few rubs the wool becomes black, and it should then be discarded and a new piece applied. Local areas can be reduced by this method rapidly and effectively.

For more drastic reduction, however, one of the simplest methods is to soak the negative first in plain water, then in a solution of plain hypo (not acid), then add to the hypo a few drops of 10 per cent solution of potassium ferricyanide. Only a small quantity of the latter should be used, as if it is increased too much it will make the negative too contrasty, and the last state will be worse than the first.

## **Intensification.**

The negative that gives a dull, flat print can be vastly improved by the chromium method of intensification. This is quite a simple process and consists of bleaching the negative in a solution of potassium bichromate—1 oz. to 25 oz. of water—to which has been added, just before use, an equal quantity of a solution of water 25 oz., hydrochloric acid  $\frac{1}{2}$  oz. The bleaching commences immediately, and soon

all trace of black is gone, leaving in its place a yellow stained film with the image quite plainly visible in deep yellow. The negative must be washed thoroughly until every trace of the yellow stain has been removed and only the yellow of the image can be seen. This is rather a long process and can be hastened by placing the negative in a very weak solution of potassium metabisulphite, and then thoroughly washing it afterwards. The plain washing method is to be preferred. The image is redeveloped now in a good amidol or M.Q. developer, and will show quite an appreciable improvement.

## **Selecting Enlargements.**

Only a small proportion of the average worker's negatives merit enlargement, but the worker should not be satisfied with first appearances. Often a negative will contain as many as three different pictures, which, together, offend the artistic eye, but, printed separately, produce pleasing results. By masking the print with two L-shaped pieces of card the amateur is able to rule off those pieces which show promise, and then the work of enlarging that portion of the negative can proceed. If the worker does not possess a masking carrier to his enlarger he can easily improvise a mask from very thin cardboard, and can also locally shade portions of the picture.

## **Spoilt Enlargements.**

It is a mistake to consign the spoilt enlargement to the dustbin, over-exposed or under-exposed, or fogged, even. Useful practice at retouching, local reduction, etc., can be put in on these pieces of bromide, and so the worker can become accustomed to using methods before he tries them out upon his more valuable efforts.

# Canals and Barges

A GOOD OUTDOOR AUTUMN  
SUBJECT FOR THE CAMERA.

By PERCY COX.

**N**EARLY every one lives within easy reach of one of our inland waterways, and there is ample material to be found along their banks to make it well worth one's while to pay a visit to one of the local canals for the purpose of picture-making.

The subject is an all-the-year-round one, but the present time is excellent for the purpose, particularly in the afternoon with a low sun and not too much foliage on the trees.

The winding waterways alone are sufficiently beautiful, especially in the countryside. Here the tree-lined towing paths and the quaint little humpbacked bridges make the canal a veritable paradise for the photographer. Added to all this, there are the barges and those Romany folk, the bargees, who eat, sleep and work aboard their small craft.

The barges are chiefly of two types, the horse-drawn and the steam propelled. Of the two, the horse-drawn type is the more picturesque. It, however, offers peculiar difficulties of its own to make it an awkward matter to get a satisfactory effect.

Most of the work has to be done from the towing path, which is usually fairly narrow, and the horse is sometimes as much as forty or fifty feet ahead of the barge. So that it becomes essential to use a fairly small stop to enable you to have both the horse and the barge in focus.

If the weather is inclined to be dull and this is not practicable, an alternative is to take up a position on the opposite bank, and take a more or less broadside view. Unfortunately, this again is not always possible, owing to the fact that a number of canals have only one towing path. This further difficulty can usually be overcome by

*From the Towing Path.*

trying to get your picture at a rather wide bend in the canal, where the barge very often overruns the horse, so to speak, thus lessening the distance between them.

The steam-propelled barge is much more easily dealt with. It is only necessary to take up a stand at some suitable place and await the arrival of your prey.

It is a good plan to wait near a bridge, say, thirty feet away, and focus on this, or set your focussing scale to this distance, as the case may be. The shutter can then be released as the boat passes under the bridge. Some very beautiful effects can be obtained in this way, with absolute assurance that the main object will be properly in focus.

## *Close-ups.*

Most of the canals are so narrow that excellent informal portraits of the barge occupants can be obtained as the barge glides past. This can be done from the bank, by setting the focussing to about fifteen feet and standing near the water's edge to make the exposure. A word of warning to reflex owners here. Do not go too near the edge of the path with your head in the hood. Canals are fairly deep and new reflexes are not cheap.

Interesting photographs of the ultra-modern new view type can be obtained by taking up a position on one of the numerous bridges. Wait for a barge to come underneath, pointing your camera downwards. Do not expose until you have the man at the helm in full view, and the effect will be, to say the least, unusual. Remember, though, that when judging distances downwards most people are apt to underestimate.

And now a few words about the camera itself. Nothing special is required in the way of apparatus. The simplest camera can be made to produce results every bit as good as the most expensive outfit. Even for the steam barges, exposures need never be faster than a thirtieth of a second at thirty feet. In fact, when I spend an afternoon on the canal bank I leave my shutter set at this speed.

Panchromatic or orthochromatic plates or films are essential. Not only to get the correct rendering of trees, water, and the grassy banks, but also because most of the barges have decorative painting on them in brilliant shades of red and yellow.

Negatives should be kept on the thin side to bring out the fullest possible detail in the high-lights.

*From the Top of the Bridge.*

### ALL OUR SHOPS ARE LEICA SHOPS

#### THE EXAKT ENLARGER

##### A DE LUXE OUTFIT.

A highly efficient Automatic Enlarger. F/4.5 Steinheil Casuar anastigmat, high-class condenser, perfect sharpness guaranteed—all you have to do is to turn the hand wheel on the support to size of picture required and then set pointer on adjusting ring of the lens to the same figure. Metal lamp-house. Wooden baseboard. Complete with all electric fittings (please state voltage when ordering). Model Ia for 2.5 to 10 times linear enlargements from 4×4 cm. negatives..... **£13:10:0**

Nine monthly payments of 31/6.  
Model II for 2 to 7.8 times linear enlargements from 6×6 cm. negatives and sections of 1/2-plate..... **£18:0:0**  
Nine monthly payments of 42/-.  
Model III for 1.7 to 6.3 times linear enlargements from negatives up to 3½×2½ and sections of 1/2-plate..... **£19:10:0**  
Nine monthly payments of 45/6.

#### THE NEW MODEL IIIa LEICA

Shutter Speeds  
1 to 1/1,000th sec.

The Precision Camera.

F/2 Summar, automatic focussing, interchangeable lens mount, auto chromium plated..... **£43:0:0**

Nine monthly payments of 100/6.  
Model III, f/3.5 Elmar anastigmat, automatic focussing, interchangeable lens mount, self-capping focal-plane shutter, speeds 1 to 1/500th sec., T. and B..... **£31:16:0**  
Nine monthly payments of 74/2.

#### THE NEW VOIGTLANDER BESSA

Takes 8 pictures 3½×2½ or 16 pictures 2½×1½ on standard 3½×2½ roll films, 620 or 120 size.

New design base-board which ensures perfect rigidity. Unique trigger release fitted under the base-board. Supplied in 8 models

##### PRICES:

F/6.3 Voigtlander anastigmat, Pronto 3-speed shutter..... **£3:12:6**  
F/4.5 Voigtlander anastigmat, Pronto delayed-action 3-speed shutter..... **£5:7:6**

#### THE ENSIGN MIDGET Magnaprint Enlarger

F/6.3 Ensign enlarging lens, specially designed condensers for enlargements up to 15×12 in., chart giving various sizes. Will also take half-V.P.K., Leica, or other small negatives. Complete with electric timing. Lens lamp.

**£4:10:0**

Also supplied to take the standard Leica lenses..... **£4:10:0**  
Nine monthly payments of 10s. 7d.

#### THE ZEISS IKON SUPER IKONTA

530 Super Ikonta with the New Rapid shutter.

No. 530. Takes 16 pictures on standard 3½×2½ roll films. Fitted 1/3.5 Zeiss Tessar anastigmat, in Compur shutter, speeds 1 to 1/500th sec., T. and B., self-erecting front, built-in range-finder, ensuring critical focus for every picture..... **£18:12:6**

Nine monthly payments of 43/6.  
No. 530/15. Takes 3 pictures 4½×2½ or 16 pictures 2½×2½, 1/4.5 Zeiss Tessar anastigmat, Compur shutter, speeds 1 to 1/400th sec., T. and B..... **£20:17:6**  
Nine monthly payments of 48/8.

#### SPECIAL OFFER

Weston Meters UNIVERSAL or LEICA MODELS (State pattern required).

Latest pattern new and unsoiled..... **£4:17:6**

(Carrying maker's guarantee). List prices £8 15s. and £7 respectively. Surplus stock, limited number only, complete in case with instructions.

#### The Multi-speed EXAKTA

Self-capping focal-plane shutter, speeds 12 to 1/1,000th sec., T. and B., delayed action 1/10th to 6 sec.

Fitted 1/2.8 Zeiss Tessar anastigmat, metal focussing hood, with magnifier, simple focussing, 3 ft. to infinity. Takes standard V.P. films. Double exposures an impossibility. Nine monthly payments of 64/2.

# Amidol—a Perfect Developer

By  
I. L. YOUNG.

MUCH has been written on the subject of amidol as a developer, but it has never been in high favour as compared with metol, hydroquinone, pyro, etc., owing to its lesser keeping qualities. Also it is not practical to make it up into concentrated stock solutions, as the solution will keep in good working order for only a few days.

Pyro, metol, hydroquinone and paramidophenol can be made up into concentrated solutions with good keeping qualities, and only require dilution with water for use. For this reason these developers are given preference over amidol. Yet this developer can be made up ready for use by a mere novice in less than two minutes by a method which will be explained later.

## Advantages.

If the amateur takes the trouble to give it a fair trial, amidol will be found to be one of the finest developers that can be used for the development of plates, papers or films; it will give results equal to if not better than any other developing agent, including those specially advocated for fine grain.

It has the further advantage that owing to no alkali being used in the formula, frilling of the negative is entirely eliminated when used at high temperatures. When used at low temperatures, where metol-hydroquinone formulae would be inactive (owing to the hydroquinone ceasing to function at 50° Fahr. and lower), amidol will work perfectly except that it takes a little longer to develop than at normal temperatures.

It can be used for tank development as well as dish, and in each case will give clean, bright negatives of very fine grain.

## Simplicity.

The chemicals required for this excellent developer are but two, amidol and sodium sulphite (anhydrous). If tank development is to be undertaken we will require the addition of potassium metabisulphite. This is not absolutely essential, but is to be recommended in the diluted form of developer used in a tank.

All we need, therefore, on our dark-room shelf is two bottles, one containing amidol and the other sodium sulphite (anhy.). With these two chemicals and some hypo for fixing

In the following article the author draws attention to the applications of amidol as an easily compounded and good all-round developer for plates and films in addition to its well-known advantages for bromide paper.

we are prepared to turn out first-class work at a moment's notice. We need have no worries as regards the keeping qualities of the solution as only sufficient is made at a time for the work we are to do. The developer can be prepared in less than two minutes, and it is not necessary to use scales as the chemicals are measured in a dry minim measure-glass, thus eliminating the time spent in weighing.

The writer has practised this method of development in India and used it in various parts of that country throughout all seasons of the year, in the Himalayas and on the Plains, and not once has there been a failure. Water which is fit to drink is pure enough for photographic use, therefore wherever one may find oneself, and provided one has a small supply of the chemicals mentioned, development can be accomplished.

True, when travelling one has not a dark-room, but a dark-room is at hand at night if all lights are extinguished and the dish used for development is covered during the process of development. A little stray light from the moon will never cause any trouble regarding fogging, provided it does not fall directly on the sensitive material; in any case a dark corner at night is always available.

## Water-Bath Development.

Amidol will also bring up an under-exposure to that of a full time exposure if the water-bath system is employed. This may be worked as follows: Divide the time proper for development into ten equal parts, immerse the plate or film in the developer for two-tenths of the total developing time, then two minutes in plain water, then a further three-tenths of the total time of development in the developer, and a further two minutes in the water bath, completing the process by immersing for five-tenths the total time of development in the developer and then again into the water bath for two minutes.

The developer is made by pouring amidol into a dry minim measure-glass to the 20-minim mark and sodium sulphite (anhy.) on top to the 80-minim mark. The two powders are then poured slowly into 4 oz. of water and stirred well. In this we have a developer ready for use in

less than two minutes and capable of yielding the finest negatives or prints.

It is advisable that each separate plate, film or print has fresh developer and is not developed in a solution that has already been used. One ounce is sufficient for  $3\frac{1}{2} \times 2\frac{1}{2}$ ; one and a half ounces for  $3\frac{1}{2} \times 4\frac{1}{4}$ , etc.

First wet the plate, film or print in plain water, pour away the water and apply the developer. With prints,  $\frac{1}{2}$  oz. is sufficient to develop a  $3\frac{1}{2} \times 2\frac{1}{2}$  print in a dish of that size, and 1 oz. will be found ample for a quarter-plate print if used in a quarter-plate dish. The amounts for larger sizes can be estimated from this.

## Acid Amidol for Tanks.

For tank development potassium metabisulphite should be used in the proportion of 44 grs. to each 20 oz. of solution. No scales are required if one dissolves 1 oz. potassium metabisulphite in 9 oz. 3 drs. of water, using 440 minims of this solution in 20 oz. of water. All that is necessary is to use this metabisulphite solution to make the developer. First pour out 4 oz. and add the amidol and sulphite as before, then dilute to two or three times its bulk with the metabisulphite solution. The developer is then ready for use, requires no bromide and has no staining action.

When used with vigorous gaslight paper the contents of the minim measure should be poured into 3 oz. water instead of 4 oz. For soft and normal gaslight paper and bromide papers ordinary strength should be used.

The Watkins factor when used for bromide paper is 12.

If desired, the metabisulphite solution may be used in place of plain water for negatives and prints, the only difference being that it acts a little slower.

Amidol ranks in a premier position for developing bromide paper, giving excellent gradations and a deep blue-black deposit without stain.

Although it is a quick and powerful developer it is safe in bringing out all detail without fog, and giving good density. The worker who tries it for the first time will be delighted with the power and control obtainable and the printing quality of the negatives obtained.

# ILLUSTRATE your

*An all-the-year-round subject for the Amateur Photographer.*

*A Knight of Poitiers—Doddington Castle.*

**H**AVE you ever thought of taking a set of photographs to illustrate all that is most beautiful and unique within the borders of your own county? Here is a real and useful application of amateur photography.

The amateur who tries it will find there is immense interest in keeping a look-out for likely subjects, noticing lighting effects at different times of day and at different seasons, and gradually acquiring satisfactory pictures.

It is a subject that can be dealt with at all times of the year; a fine day in autumn or winter will yield just as good pictures of many outdoor subjects as a day in summer.

Mounted in an album, a set of prints illustrating the county, titled and briefly described, will create an unexpected amount of interest, and at the same time pleasure to yourself and your friends. It is astonishing how we all read about, visit and photograph foreign countries or other parts of England, but ignore the heritage at our very doors.

Having once steeped yourself in the lore of your own county, not only does it make every journey in it full of

possibilities, but you will find yourself wanting to share your store of information.

The photographs will prove an excellent basis for articles and for lantern lectures to guilds and societies which are out to encourage local knowledge and local pride; also you can lend them to exhibitions, like those arranged by branches of the Council for the Preservation of Rural England.

The advantage of taking photographs nearer home is that you can bide your time or pay a return visit under better conditions. It is also easier to be accompanied by a suitable model whenever a little human interest would be an advantage.

If your county is already much described and photographed you can set yourself to obtain real pictures where others have been content with conventional postcard views, or to

*A Cheshire Preaching Cross—Nether Alderley.*

*Stacking Peat at Lindow Moss.*

discover entirely fresh subjects. If, on the other hand, it is comparatively unknown then you have all the thrills of pioneering, and your stock of photographs will be of unique value.

Every county is sure to have some exclusive features in its scenery, architecture, historical and literary associations, customs, occupations or sports. Books about them are easily obtained from public or reference libraries or by post from the county library.

It is a good thing to have a loose-leaf book and gradually acquire interesting notes under any heading likely to offer pictorial scope. When you have a definite object in view and know your

# own County

By WINIFRED M. COMBER.

subject it is much easier to obtain access to places where the public in general is not admitted.

The accompanying photographs will show how I am putting all this into practice in Cheshire, and will serve as a guide to other "A.P." readers living elsewhere. No. 1 is of the ruins of a fourteenth-century castle situated in a private park and known to very few people. It has figures of five Cheshire knights and squires who covered themselves with glory at the battle of Poitiers (1356), holding a lane against an overwhelming French force and earning the unstinted praise of the Black Prince. The church at

*A reach of the River Dee.*

*The Church at Lower Peover.*

quite a number of men stake out claims and spend their evenings cutting, drying and stacking peat for sale.

No. 7 shows the treacherous estuary described by Charles Kingsley in his tragic ballad, "The Sands of Dee." Mrs. Gaskell, author of "Cranford" and "Mary Barton," spent her childhood in Knutsford, and was buried in the little

Lower Peover (No. 4) is considered one of the most perfect specimens of black-and-white timber work in the entire country, and the interior is quite in keeping.

No. 3 recalls the Hebrides, but was actually taken on Lindow Moss, which is ten miles from Manchester. Here

*The Sands of Dee.*

*The Chapel at Knutsford.*

Unitarian Chapel shown in No. 5. It was built in 1689, and at first the Sunday service lasted from nine till four.

No. 2 shows a typical preaching cross of which the upper part was probably destroyed during the Reformation, and is now smothered by a thorn said to be associated with that of St. Joseph of Arimathea at Glastonbury. A few photographs can always well be devoted to the beauties of natural scenery. No. 6 shows a reach of the River Dee as it approaches Chester. This was taken in summer; the others at different times of year.

# NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

In a recent issue of "The A.P." a correspondent was advised to use oil of almonds as a preservative for photographic paste. Readers should note that the "essential oil of almonds" is indicated and not the ordinary almond oil which would have no preservative action.

The opening of the winter session of the G.E. Mechanics' Institution Photographic Society on Wednesday, October 2nd, was marked by a pleasing ceremony in the presentation of a suitably engraved attaché case to Mr. H. W. Bennett, to mark his forty years' association with the Society. In making the presentation on behalf of the members, Mr. F. G. Perry, the General Secretary of the Mechanics' Institute, paid high tribute to the untiring services rendered to the Photographic Society of the Institute by Mr. Bennett. He said he could not recall a single instance in that very long period of association with the Society when Mr. Bennett had failed "to turn up." This probably constitutes a record.

The Catalogue of the Fourth South African Salon organised by the Johannesburg Photographic Society has just come to hand. Judging by the entries that were sent in from all parts of the world it can be regarded as a considerable success. The Gold Plaque this year was awarded to H. A. Scherrer (Indianapolis), the Silver Plaque to A. Campana-Bandranas (Barcelona), and the Bronze Plaque to L. Misonne (Belgium). Congratulations to all concerned.

**Stolen.**—During the night of October 4th the office of the Herts Institute of Agriculture, Oaklands, St. Albans, was entered and two cameras were

stolen: (1) Plaubel Makinette 3×4 cm. Roll Film Camera (16 on V.P. size), f/2 Supracom lens in Compur shutter; camera had on it an improvised lens hood and was contained in a zip-fastener tobacco-pouch. (2) 3×2 in. Voigtlander Roll Film Camera, f/4.5 Heliar, 8-cm. focus, old type Compur, in a press-clasp soft leather case; both cameras in "as new" condition. Any information regarding these should be sent to the County Police, Fleetville, St. Albans, Herts.

The International Exhibition of Nature Photography, organised by our contemporary *Country Life*, will be officially opened in the Whale Hall of the British Museum (Natural History), South Kensington, S.W.7, at 12 noon, on Wednesday, October 16th, by the Earl of Onslow, President of the Society for the Preservation of the Fauna of the Empire. The object of the exhibition is to show the advance nature photography has made during recent years, and should be of considerable interest and educational value. It will remain open every day from 10 a.m. to 6 p.m. (Sundays, 2.30 p.m. to 6 p.m.), from the 16th October to the 30th November. Admission is free. Over 1,200 photographs of birds and mammals will be shown, including examples from all our colonies as well as from the United States, Poland, Japan, etc., etc.

Many serious amateur photographers who are interested in photo-electric exposure meters—particularly the Weston meter, should note that the Camera Company, of 320, Vauxhall Bridge Road, S.W.1, are offering a limited number of these meters in new condition, but at considerably reduced prices, at their current sale. Full particulars will be supplied on application to the above address.

The Hon. Secretary of the Ilford Photographic Society has asked us to point out that considerable confusion and delay is being experienced through intending members addressing their letters to Eastern Avenue, Romford, instead of Eastern Road, Romford. Eastern Avenue is the name given to that portion of the new Southend Road which runs through the town, and it is some distance from the Secretary's address. There are still vacancies for new members—whether beginners or advanced workers, and enquiries will be welcomed. Address—L. S. Shaw, Hon. Secretary, 39, Eastern Road, Romford, Essex.

Interest in motor boating grows apace, and the Marine Section at Olympia increases in attraction yearly. All who would like the fullest possible particulars of the exhibits would do well to make sure of obtaining the two Special Show issues of *The Yachting World* dated October 18th and 25th. Not only do these deal fully, by means of description and illustration, with the exhibits, but are invaluable for reference purposes after the show.

The Sutton and District Movie Makers intend to start a "still" photography section under the direction of Mr. Howard Bateman of their Club, and invite anyone who is interested to communicate with the Hon. Secretary, Desmond F. Sheen, 32, Brighton Road, Sutton, Surrey, who will be pleased to give full particulars.

The "Kingston-upon-Thames and District Photographic Society" has changed its somewhat cumbersome title to the "Kingston Camera Club." It holds weekly meetings on Mondays, and a dark-room for members has been opened at 55, Surbiton Road, Kingston-upon-Thames. The annual subscription is 10s., and amateurs residing in the district should get in touch with the Hon. Secretary, V. W. Barnes, 1, Cadogan Road, Surbiton.

## Exhibitions and Competitions

CURRENT AND FUTURE.

Notices of forthcoming exhibitions and competitions will be included here every week if particulars are sent by the responsible organisers.

*The Amateur Photographer* Monthly Competitions for Beginners, Intermediate and Advanced Workers. Entries, October 31. Rules in issue of September 25.

California Pacific International Exhibition, San Diego.—May 29–November 11. Miss Ruth Kilbourne, Secretary, Exhibition Headquarters, Balboa Park, San Diego, Cal., U.S.A.

Paris International Salon.—October 5–20. Secretary, M. E. Cousin, 51, Rue de Clichy, Paris.

Irish Salon (to be held at Mansion House, Dublin).—Open, November 2–9. Particulars from Hon. Secretary, Irish Salon of Photography, 18, Morehampton Road, Dublin.

Rotherham P.S. International Exhibition.—Open, October 16–19. Hon. Exhibition Secretary, E. George Alderman, Ruardean, Newton Street, Rotherham, Yorks.

Indian International Salon (promoted by Camera Pictorialists of Bombay).—Open, November 17–30. Hon. Salon Secretary, F. R. Ratnagar, Central Bank Building, Fort, Bombay, India.

G.W. Rly. "Camp Coach" Holiday Competition.—Prize, one week's holiday in camp coach during 1936 holiday season. Photographs should depict any aspect of camp coach holiday. Entries due, October 31. Further particulars from Superintendent of the Line, G.W.R., Paddington Station, W.2.

Canadian International Salon, National Gallery of Canada, Ottawa.—November 6–21, and afterwards in

other Canadian cities. Entry forms and further particulars from Exhibition Secretary, Canadian International Salon, National Gallery of Canada, Ottawa, Canada.

Seventh Western International Photographic Salon.—November 23–30. Entries close, Monday, October 28. Particulars and entry forms from the Organising Secretary, W. H. Hill-Muchamore, 24, Church Road, Redfield, Bristol, 5.

Cape of Good Hope International Salon (under the auspices of Cape Town P.S.).—Entries due, November 10; open, January, 1936. Hon. Salon Secretary, Richard Dekenah, P.O. Box 2431, Cape Town, South Africa.

IXe International Kertsalon Fotografische Kring "Iris".—Open, December 22–January 5, 1936. Entries close, November 15. Particulars and entry forms from J. Van Dyck, Secretary, "Iris," 69, Ballaerstraat, Antwerp.

Third (Second International) Wilmington Salon of Photography.—Open, January 6–26, 1936. Last day for entries, December 15, 1935. Particulars and entry forms from the Salon Committee, Delaware Camera Club, P.O. Box 818, Wilmington, Delaware, U.S.A.

Leicester P.S. International Exhibition.—Entries, January 24, 1936; open, February 24–March 7, 1936. Exhibition Secretary, H. Foscutt, 19, Doncaster Road, Leicester.

The 40th Annual Exhibition of the South London P.S.—Open, February 15–March 14, 1936. Entries close, January 21. Further details and entry forms from Hon. Exhibition Secretary, H. S. Adams, 40, Stockwell Park Road, London, S.W.9.

Scottish National Salon.—February 8–29, 1936. Entries close, January 11. Particulars and entry forms from the Hon. Salon Secretary, Norman G. Brown, 36, North Lindsay Street, Dundee.

Ilford Photographic Society.—Annual Photographic Exhibition. From Monday, March 2 to Saturday, March 7, 1936. Closing for entries, Saturday, February 1, 1936. Particulars and entry forms from E. G. Roughton, 63, Havering Road, Romford, Essex.

City of London and Cripple Gate Photographic Society.—Thirty-first Annual Photographic Exhibition from March 16–21, 1936. Entries close, February 10, 1936. Particulars and entry forms from the Hon. Exhibition Secretary, A. C. Mundy, 11, Monkham Lane, Woodford Green, Essex.

VIIe Salon International D'Art Photographique de Bruxelles, 1936.—Open, from March 21–April 5, 1936. Entries close, February 25. Particulars and entry forms from M. M. Devaivre, 152, Rue Maréchal, at Brussels 3, Belgium.

Darwen Exhibition of Photography.—April 20–May 2, 1936. Entries close, March 19. Particulars and entry forms from the Secretary, J. H. Woods, South Down, Bolton Road, Darwen.

# AT LAST A PROJECTOR TAKING 3 FILM SIZES!

## 8-mm. 9.5-mm. 16-mm.

THE NEW

## PAILLARD-BOLEX

MODEL G. 3

This remarkable Paillard-Bolex achievement marks a tremendous step forward in projector design and utility, because never before in the history of sub-standard films has it been possible to project THREE FILM SIZES with one machine.

Ciné users who look ahead will appreciate the wider scope this new model G.3 projector gives, enabling them to choose films from 8-mm., 9.5-mm. and 16-mm. libraries and thereby giving them access to the many interesting films that are certain to be available **only in 8-mm. libraries.**

When it is realised that for the projection of 8-mm. films the cam has to travel twice as fast as for 9.5-mm. or 16-mm., it will be seen that Paillard's engineers have succeeded in overcoming tremendous difficulties.

### SPECIAL OPTICAL SYSTEM much larger pictures from 8-mm. films without increasing "throw."

By means of the special eccentric lens of a shorter focal length than has been available before ( $f=20$  mm.) it is possible to project larger pictures at a comparatively small "throw," so that "personal" movies shot on 8-mm. can now be seen on a bigger screen.

### OTHER DISTINCTIVE POINTS

Change over from one film size to another only takes a few seconds and no tools are required. The mechanism and high standard of illumination are the same as the well-known Model G.916. One hundred per cent gear driven. Automatic rewind. "Still" pictures for any length of time without blistering film.

**PRICE** Model G.3 for projecting 8-mm., 9.5-mm. and 16-mm., with all accessories, fitted 2-in. lens and 500-watt lamp ..... **£60**

500-watt resistance.....£2 10 0  
De luxe carrying-case .....£4 5 0  
Hugo Meyer special eccentric  $f/20$  mm. lens for projection of 8-mm. film .....£4 0 0

Model G.916 for projecting 9.5 and 16 mm. films. **£47**  
PRICE, with Dallmeyer 2-in. lens and 500-watt lamp

# how I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CCCIII.

Mrs. LAURIE  
BLACK.

From information communicated to our Special Representative.

"PATTERN, light and shade, and quality are the three things I always want to see in a finished picture; subject matter comes fourth—a long way behind. Therefore it naturally follows that I very rarely use my camera when the sun is not shining more or less brightly.

"Broadly speaking, the part seems to me very much greater than the whole, and frequently the true meaning of one's picture can be adequately suggested without the inclusion of either a great deal of 'subject' or of unnecessary detail. The more one uses a camera with such ends in view the more one sees pictures at every turn, but

often, unfortunately, when the subject is unphotographic at the time, or when the camera is at home.

"Because of my love of light and shade, and their subtle rendering, I have no interest in producing a print which is not an absolutely straight reproduction of the subject. Therefore all my prints are unfaked enlargements on the paper that best suits the negative. I have never in my life printed-in a sky.

"I know nothing about the academic rules of composition, and care for them still less; but a picture has to please *my* sense of balance and spacing, and this seems to work out all right in the long run. I always endeavour to get the picture, the

whole picture, and nothing but the picture on the negative, and it is very rarely indeed that I use a part of the negative only. This naturally leads up to some technical details.

"Working in this way a reflex camera is my ideal tool—an old warrior of a  $3\frac{1}{2} \times 2\frac{1}{2}$  T.-P. reflex, with a Cooke 5-in. f/4.5 lens which is interchangeable with a soft-focus lens. This is the only camera I ever use, and I would not part with it for untold gold. I use Agfa Isochrom film packs almost exclusively, and work with a K 1 or K 2 cut gelatine filter, which can be slipped between the components of the lens.

"The negatives are developed in a large tank with pyro-metol-hydroquinone; and one fill of this tank lasts a summer, with the addition of strengthener from time to time. I use a home-made vertical enlarger, and print on chloro-bromide paper whenever possible, with ordinary bromide as a reserve for awkward negatives. The papers I prefer are Kodopal and Kodak Royal.

"I find I can sometimes get very interesting effects with slight grain, giving almost the effect of a print from a paper negative, by using Kodaline and printing through the back of the paper, not forgetting to put a sheet of black paper under it to avoid reflection from the easel.

"I belong to the Torbay Camera Society, and two circulating portfolios, which I find a great incentive, particularly because in this way one has opportunities of seeing other people's work and experiments."

(A further example of Mrs. Black's work is reproduced on one of the centre Art pages.)

PATTERN.

Mrs. Laurie Black.

# Pictorial Analysis

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"THAMES SUNSET," by K. M. Trathen.

FROM the many impressions that have been produced of this stretch of the Thames, this effort is distinguished by two things, the first being the fact that the bridge is seen in silhouette, and the second that the subject has been treated as a foreground study.

The first of these two features lends a sense of simplicity to the arrangement, and the second, in differing from the normal impression, creates an element of novelty, and conveys the idea of an original and individualistic point of view. It is fully warranted, as a departure from the usual thing, by the fact that the main attraction is led up to and indicated from the lower portion of the print, the centre of interest lying in the tug (1) and the splash of light with which it is surrounded. In these circumstances, the bridge (2) becomes a part of the setting, but, while of not inconsiderable importance, it is relegated to its proper place in the scheme, partly on account of tonal treatment, and partly by reason of its placing.

Being seen against the light, its tones are simplified and it appears as a flat mass of even depth. The distinctions of detailed differences in value, such as would be manifest under a side or frontal lighting, are merged and lost in the one uniform tone. So that, while the fine shape is retained, it is freed from the assertiveness that might have been evident if its detail had been visible. It is subordinated to its true function as an element, though significant, of the setting for the prime feature—the boat. This, unquestionably, is the most important item in the picture. Not only does it provide the only dark of any real depth, but its strong tone is most powerfully emphasised by the surrounding light. The remainder of the picture consists of varying degrees of half-tone, and, in these quiet harmonies, such a forceful combina-

tion of extremes of contrast inevitably compels the attention.

Its importance is further stressed by its force of position, and, altogether, it is sufficiently dominant to create that degree of unity that is necessary to ensure a well-arranged composition. That feeling is helped, of course, by the way the lines of the picture lead up to the point (1)—as indicated

for, instead of coming straight down the picture as it would if the water were smooth, it is spread out into a most acceptable form, and, besides, is of assistance in furnishing some of the leading lines.

It could be wished, nevertheless, that the rendering in the immediate foreground were a little less blurred and the out-of-focus effect avoided by the use of a smaller stop, accompanied, if necessary, by a suitable adjustment of the focussing distance. An out-of-focus background, if the principal object is sharply defined, may be tolerated on occasion, but a fuzzy foreground is too obvious to be permitted. No doubt a similar effect will be guarded against in the future, and another thing that needs to be watched is the way the depth of tone in the tug—the hull particularly—is reduced by halation. Where a strong light comes up against a dark, a certain spreading of the light is inevitable. It may arise through halation, which is caused through light being reflected from the back of the plate, or through irradiation, or spreading of light within the film or sensitive emulsion itself. The former may be considerably minimised by the use of backed plates, and the latter by limiting the extent to which development of the negative is carried.

Now that the negative is made, however, neither of these expedients is available, but it is possible by retouching on the negative, and, if necessary, on the print, to prevent it from so markedly disfiguring the subject, and the needed correction might well be essayed.

Rubbing down with Baskett's reducer seems to suggest itself as the most convenient method; but, apart from this, the subject has been very well seen and admirably executed. The against-the-light effect is most attractive, and, from the technical point of view, the work is sound and of excellent quality. "MENTOR."

in the sketch—but the prime factor is the undoubted principality of the tug.

The composition seems very finished and complete, and the long foreground is justified, in a measure, by the suggestion of originality already mentioned, but, to a greater extent, by the way it is diversified and embellished by the wash of another boat—presumably that from which the subject was taken—or, possibly, one that had passed. The wash is responsible for the way in which the light is reflected,

# PICTURES by Novices

## SOME CRITICAL COMMENTS on the Beginners' prints reproduced on the opposite page

EXCEPT for the fact that there is something of an excess of foreground and a corresponding lack in the upper parts, No. 1 of the prints reproduced on the opposite page—"A Wet Day at Rochester," by E. R. McNaughton—is nicely arranged, and, without doubt, the impression of rainy weather lends a measure of pictorial attraction.

### Sunshine and Rain.

It seems to represent nature in a despondent mood, and, though it may arouse an artistic emotion, it is one of melancholy rather than joyfulness. It is quiet rather than assertive, and, while it has a beauty, it is somewhat overshadowed by the more immediate response that is elicited by some of the others.

Possibly its attraction is minimised by a suggestion of flatness in its tones, and there is no doubt but that there is a lack of vigour and a desirable degree of contrast that might have been obtained by the choice of a printing paper of more contrasty character. Moreover, there is a certain blankness in the deepest tones that seems to indicate a measure of under-exposure, although, in the absence of the negative, it is impossible to confirm this.

If the negative shows no deposit in the darks and these are represented by clear glass or unobscured film, it is a sure sign that the fault is present, and, though the substitution of a more vigorous paper would improve the general appearance, it could not possibly reproduce detail that did not exist in the negative.

Nevertheless, the subject does convey a good impression of a rainy day, and, in so far, may be regarded as successful. No. 2, "Sunshine," by A. King, represents a more joyous effect, and in its brightness there is an immediate appeal.

### Strength and Weakness.

Here again, the subject was very well seen, and, in its arrangement, there is little ground for serious criticism, but, just as the former was inclined to flatness, in this instance the inclination is in the opposite direction and the print is somewhat too vigorous. The obvious remedy is

the reverse of that recommended for the other. A softer type of paper would provide lesser contrast and a greater degree of harmony, but, unless the paper were much too soft, would retain all the vigour and brightness necessary to keep the impression of sunshine.

A rendering that just about steers a middle course between the lack and excess of vigour displayed by these two prints is No. 4, "Real Morocco," by Miss H. Wesson, where there is plenty of strength, where the sunshine finds full expression, and where there is none of that feeling of exaggeration that the other two excite.

The figure, too, has been wonderfully well caught, and, as the centre of interest, his figure serves extremely well. Strictly speaking, the sunlight on his robe should be the brightest light, whereas, at present, that on the wall on each side of the arch is stronger, but, if another print be made, the necessary adjustment might be made by local control during printing.

### Valuable Shadows.

The part that is played by shadows in showing up the sunshine is well displayed in this example, and, altogether, it is a remarkably successful effort in its class.

Still, the pun employed for the title—*vide* our remarks in last week's issue—is to be deplored, for something more appropriate and less tricky could very easily be substituted. Another subject of not dissimilar type—both contain an archway—is to be seen in No. 3, "Gateway, St. Patrick's Hall," by Ronald Siddle. Here, unfortunately, the sunlight, although present, does not tell nearly so well, and, as will doubtless have been already gathered, the primary reason is a deficiency of shadow.

The gateway itself is in full light; the vista seen through it is equally well lit; and the only significant shadow is the small one seen through the base of the archway. This is obviously not enough to force up the sunlight, particularly as it is not very strong in itself.

It rather seems as though the only chance of getting a real effect of sunshine is by the choice of a much earlier hour for making the exposure.

This choice of time, when possible, is often very important.

### Time and Theme.

If the wall composing the arch were shown in shadow and the vista in sunshine, the latter would tell with good effect. Such a state of affairs might be expected to obtain some hours before, and it is then that the theme would be seen at its best.

No. 8, "Patio of Medersa," by Guy M. Emerson, compares very favourably with the print just discussed, for there is, at all events, quite a reasonable proportion of shadow tone. In consequence, the sunlight seems to stand out very well; though, had it been found possible to include another shadow on the extreme left, not only would the sunlight gain in attractiveness, but the composition would seem better balanced.

In this respect, No. 7, "Old Street in Normandy," by E. H. Littledale, shows to advantage, for on each side there is an element of shadow, the main effect of light being in the distance. The sky, however, is almost totally devoid of tone, and, on this account, competes so strongly with the sunshine as to render its attraction negligible.

### Competing Elements.

For the same reason, the sunlight on the buildings in "The Home Office" (5), by H. Kington, fails to draw the attention as it should, and, from experience, the only way to make certain of a sufficiency of tone in the sky is to employ panchromatic emulsions suitably screened, and to take care that the lighting is such as to illumine the subject more than the sky.

Alternatively, as was done in Nos. 2, 4 and 8, the sky could be excluded altogether, but this is avoiding the difficulty rather than surmounting it.

Similarly in No. 6, "Joan of Arc," by Lester Gardner, it is felt that the interest ought to centre in the group of statuary, but, owing to the brighter light of the windows above, they attract a greater share of the attention. It might be possible, by moving a little to the left, to cover up the windows with the pillar behind the statue, and to show it against a darker setting. "MENTOR."

# With the Beginners

## NOTES AND NOTIONS FOR THE LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

### FILTERS FOR BEGINNERS.

THERE is no doubt that a great many beginners sooner or later become anxious about the use of filters, especially when they see comparative photographs taken "with" and "without." They come to the conclusion that they really must have a filter, and innocently ask what sort to get, and what difference it will make to exposure times and results. This is all very well, but I would advise the beginner not to get too excited about it.

The whole question of different kinds of sensitive materials, and the use of appropriate filters in various circumstances, is difficult and complicated, and many aspects of it do not really concern the beginner's work at all.

We may, however, consider some of the simple facts.

As I have pointed out more than once, we want our photographs to look reasonably "natural." We know there is something very much amiss if we find a bright yellow flower come out black in the print, or a blue sky white. These are familiar examples.

Fig. 2.

The general idea is that very often the tones of the print, from black through many shades of grey to white,

do not fairly represent the "brightnesses" of the objects as the eye saw them. The "tones" do not correspond to the colours.

An ordinary plate—such as all plates once were—is more or less "blind" to greens, yellows and reds. An orthochromatic (isochromatic) plate is not so blind to greens and yellows, but it is to reds. A panchromatic plate is sensitive even to reds. But all three types of plates are too sensitive to ultra-violet, violets and blues.

We can make all sorts of modifications by making the light rays which pass through the lens to the plate also pass through a "filter." This may allow some of the colour rays to pass fully and freely, while it keeps others out partly or completely.

If we shut out some of the rays which would otherwise affect the plate it is clear that we must increase the exposure time to allow the remaining rays to do the necessary work. The extent of this increase is represented by the "factor" of the filter. This factor is not always by any

Fig. 1.

means the same even for the same filter, which may require a higher or a lower factor according to the character of the plate and of the light. For example, with an Ilford Soft Gradation Pan. plate the "Gamma" filter has a factor of 4 by daylight, 5 by arc light, and 3 by half-watt light. On another kind of plate these factors for the same filter might be very different. Filter factors may range from 1 to 3,000!

This is a mere sample of the difficulties involved. What is the poor beginner to do about it all?

My advice is that at first he does very little. He should take a very short step in the right direction, and he will find it so useful that later on he will wish to go farther, and will find no difficulty about it.

In the great majority of cases the beginner works by daylight, with ordinary roll film which is orthochromatic. His chief trouble is that the blues are rendered too light in his prints. He gets white skies and cannot "keep" his clouds. If only the blue sky would come out a shade or two darker the bright yellowish clouds would stand out better. Just so. All he has to do is to slip a pale yellow filter on his lens. With most roll films it may mean no more than

Fig. 3.

doubling the exposure; he can use  $f/8$  instead of  $f/11$ , or give  $1/25$ th of a second instead of  $1/50$ th.

Fig. 1 was taken without a filter, Fig. 2 with a yellow one. In the reproductions there is very little

difference; in the originals there is more, but nothing sensational. The most obvious difference is that the blue of the sky is some shades darker in Fig. 2, and the very small clouds present are recorded as they appeared.

Fig. 3 had much more need of the filter, as the bright light blue of the sky would not have been held back as it is, and the contrast would have been lost. It is when the subject includes blues that would come out too light in tone that the simple filter proves its value. If there are no such important blues the filter need not be used. Many skies can be rendered quite well without it. Nor should the filter be used when it is desired to record the effects of haze and mist.

It is advisable to try various subjects both with and without the filter, and to study the results carefully to see what differences, if any, are apparent. There is no other way of learning when to use the filter. Next it will be well to try experiments with a deeper yellow filter, and so learn when this can be used to advantage. There will be plenty to do before worrying about panchromatic material, and green, red and other filters. Anyhow, try a pale yellow one first.

W. L. F. W.

## IN THE DARK-ROOM

By "FLEETWING."

**N**OW that the dark evenings are here, many beginners who have in the past been content with just "button-pressing" (horrible expression), will try their hand at developing and printing. They will soon find that they have been missing more than half the pleasure which photography affords, to say nothing of the saving in cost of the production of the finished photographs.

This article is not intended to teach developing and printing, for these subjects are being dealt with frequently in the pages of "The A.P.", but the following hints for those just starting dark-room work may prove useful.

The author has found that it pays the amateur to purchase his requirements from a real photographic dealer, and not one who deals in films, etc., as a side-line. You will find that the majority of good dealers are always willing to assist the beginner, and by choosing one and getting to know him, you will have the benefit of his personal attention.

If possible, a room or large cupboard should be set aside and used as a dark-room exclusively. This is not a luxury, for ease in working will make for better results. If you do not wish to go to the expense of fitting a large sink in the dark-room, two tables will answer the same purpose. Tables can be picked up quite cheaply at second-hand shops, but select those which are not too low, but by which you can stand up and handle the dishes, etc., comfortably. The tables may be covered with lino; this will prevent any spilt liquids dripping through the table on to and staining the floor.

If the tables can be definitely kept for photographic purposes it is a good plan to nail a narrow fillet of wood round the edges of the top before covering with the lino. This will make the table-top into a shallow tray that will retain any water or chemical solutions that may overflow.

If running water is not available in the room a good supply in a couple of enamelled bathroom jugs should be kept handy, to be readily found in the dark. A large bucket should be placed conveniently under the table for waste.

Preliminary washing of plates, films or prints after fixing can be conducted in the dark-room and completed elsewhere, say the bathroom, where there is running water.

With regard to the dark-room illumination, it is folly to purchase a cheap dark-room lamp; get a good one which you know will be safe. Any good dealer will be pleased to supply a catalogue of dark-room lamps and equipment.

When working, see that the developer and hypo dishes are as far apart as possible. Have the water supply next to the hypo dish so that you can transfer the fixed films, plates or prints direct into the water without passing them over or near the dish containing the developer. A minor detail, but nevertheless important, is that it is a good plan to have two towels in the dark-room, marked "Hypo" and "Developer." These are for use when you are at work to assist in making clean prints by keeping your hands free from the chemicals when handling unexposed paper, etc. Mark your bottles and dishes and always keep them for the same liquids. Wash and clean all dishes after use, also measures; they will soon become stained if you neglect them.

A cupboard, fitted with a door, in which to keep plates, films, and papers, is very useful, and will keep out the photographer's greatest enemy—dust.

In conclusion, when you have finished an evening's work in the dark-room, don't forget to put away packets or boxes of unexposed paper, etc. A clean and tidy dark-room is a pleasure to work in and will assist in making the hobby of photography all the more enjoyable.

# Picture Points

## for Beginners, by RICARDO.

### More Examples of Triangle Construction

READERS who saw last week's series of "Picture Points" will recognise that the first sketch, which was an improvement on one of a similar construction, has now been further improved. It will be remembered that by making a more interesting group inside the main triangle and by slightly altering the position of the yacht, the second triangle, we had a more pleasing arrangement of the same subject matter.

Bearing in mind that a group of three items as two and one, is invariably better than a group of two together, let us introduce a third item, the nurse and perambulator, still maintaining a triangle construction in itself. This grouping is further illustrated by the diagrams on the right of this page.

We now have a more interesting picture with a pleasing repetition of the triangles varying in size, grouping and subject matter.

Let us now see the effect of introducing more triangles. In the

second sketch we can count no fewer than seven such shapes and it will not be disputed that the idea of repeating the shapes in order to get variety is now carried to the extreme and so defeats its own purpose.

### Sloping Lines in the Picture

PREVIOUSLY in this series, we have dealt with many factors that contribute towards maintaining interest in the picture. We have now a problem of sloping "verticals" when they appear near the edge of the picture. Although the illustrations deal with boats, the principle applies to most of the subjects where such similar sloping lines occur.

In both sketches the positions of the hulls are approximately the same on the horizontal line and, although the masts slope in different directions, outwards in the left-hand sketch and inwards in the sketch on the right, both have good balance, and it is difficult to say which is the more pleasing.

But, if in the right-hand sketch the same three boats were wider apart and almost touching the edges of the print, the tendency would then be for the eye to follow the downward direction of the masts out of the picture, even though the hulls seem large and dark enough to prevent this. The remedy is to turn the direction of the masts outwards as seen in the left-hand sketch, in order to maintain interest in the picture.

Now let us imagine the boats in the left-hand sketch much nearer to each other. A V-shaped formation is the result, making the composition weak and unstable in the centre of the picture. So it will be seen that each sketch shows, approximately, the limit to which its sloping lines can go in relation to the edges and centres of the print.

### A Simple Exercise in Grouping

TO make a pleasing group of several objects and maintain good balance and composition at the same time, seems to be a bewildering process for many novices. If, however, it is tackled in a simple way as shown in the sketches, many of the difficulties will disappear and a good idea of balance will be gained.

For simplicity's sake, we will take three simple shapes, No. 1, each equal in tone, and keep the largest, called A, on the left throughout the experiment and vary only the positions of B, the next largest, and C, the smallest.

No. 1 being far too regular to be pleasing, let us move B a little to the left. Notice now, in order to restore horizontal balance, C is moved to the right. This is better than No. 1, but the narrow gap between A and B is ugly, so we will overlap the two. Their combined weight seems a little heavier so C is moved slightly to the right.

This is more effective, but we can make the common base line much more interesting. No. 4 shows the same grouping, but because the base lines are at variance, and a third dimension and vertical balance are introduced, it is more effective. In No. 5 we see the effect of changing over B and C, and because of the now lighter weight on the left, B now on the right must be moved in a little.

Let us now see the effect of moving C over to B. We still have good balance and grouping, but it divides the interest between the two masses and is not nearly so interesting as 4 or 5.

One of Kodak's famous Panchromatic Pair is bound to suit.

**"PANATOMIC"**—the film with an extremely fine grain, or

**"S.S. PAN"**—the film of extremely high speed.

Both are fully panchromatic, double-coated, anti-halation backed.

**KODAK "PANATOMIC" FILM**  
**KODAK SUPER SENSITIVE PANCHROMATIC FILM**

Both are made in Roll Films and Film Packs.

# Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

## A Ciné Camera at Croydon

By

M. A. LOVELL-BURGESS.

AVIATION is the one subject which has power to engross all young people, and the amateur cinematographer who can show an aviation film—even without a Jean Harlow, Clarke Gable or Wallace Beery featuring in it—is sure of an audience.

That being so, it is surprising that so few amateur cinematographers make use of the free photographic facilities afforded by aerodromes, such as Croydon Aerodrome. It is true that there are camera restrictions at Government air-ports, but these do not apply at municipal or civil aerodromes. And permission is readily given to individuals or groups to go over the Croydon Aerodrome in charge of a guide. It is a tour well worth making and well worth recording.

To make a really successful aviation film you need to be air-minded. That is not to say you must be a qualified pilot, or even one who has "been up," but you must be able to capture in film something of the thrill and wonder of it all.

When I took my camera to Croydon Aerodrome last month, an aeroplane had just left for Gaza, in Palestine, with a consignment of Treasury notes. (Gaza was in ruins the day when Abraham went by with his flocks.) As I stood on that wide, sunlit sweep of cement, which seemed to be almost a second sky, my guide pointed out a tiny speck in the sky, and told me it was the Paris 'plane, which was "due in." In a few minutes the 'plane was circling twice over the aerodrome—a precaution which is always taken before landing—and soon the giant silver 'plane stood glittering before us. It made a beautiful picture, especially when, half an hour later, it set out again, skimming for half a mile or so over that vast area of cement and field like a white ship, before taking once more to the blue heights.

Between this arrival and departure came the blue-and-silver Royal Dutch air-liner out of that vast, empty sky, and for a few minutes it was Dutch which was being spoken. But your film would, of course, include not only the arrival and departure of the big air-liners, but also those little monoplanes which shoot up and away like so many blue butterflies.

Other shots for your film would include the working of the signals, passengers ascending or descending the gangways, the booking-office, the vast

hangars with their medley of aircraft, the workshops, where a member of the party could be filmed examining aircraft mechanism in detail, together with a few illustrations of how wind-resistance on the newest aeroplanes is reduced to a minimum by such streamline devices as door-handles let in flush with the structure, and covered with outer "doors" of fabric. A few shots of the varying interiors of machines can be made if someone will hold the door open for you. Some of these interiors are spacious, as in the Dutch air-liners, for example, which are upholstered in blue leather, with chromium fittings and brown veneered woodwork.

Remember that a few odd shots of silver wings or whirling propellers are invaluable when you come to the editing of your film, and want to convey, by simple montage or cutting, that touch of imagination which will make the whole thing "live" in the minds of those who see it.

The lordly pilot on his way to the control tower, the very young Imperial

Airways guide, in his dark blue uniform and white peaked cap, the engineers racing in their brightly-coloured motor tractors from aeroplane to aeroplane, are all part of the lively scene, as are the groups of passengers taking refreshment on the wide balcony of the adjacent hotel.

From this balcony, and from the central flat roof-top which is open to visitors, some fine camera angles of the aerodrome as a whole can be obtained. Varying angles and close-ups give a certain vitality and redeem a film from flatness.

Take a filter with you in case there should be a few clouds in the sky. Remember the sky is a big part of your subject and dramatise it for all it is worth. When you are not very sure of your continuity it is a good thing to take plenty of still close-ups which you can use when editing to fill up gaps. A close-up of the large diagram, complete with model aeroplanes, which tells the pilot the prevailing weather conditions, would be useful in this connection.

*An air-liner making ready to start at the Croydon Aerodrome. A phase of the subject referred to in the article on this page.*

Of course, you and your camera will go up on one of those five-shilling "flips." To get a picture of the earth below you, with the Crystal Palace looking like a child's toy, and the shadow of your aeroplane flying adventurously far below you over the fields and houses, it is necessary to slide back the little window and to support your camera

against the structure of the machine.

On Sundays and holidays crowds of people pay one penny to go on to the little piece of private ground adjoining the aerodrome where they can watch not only the official comings and goings, but also the whole process of the five-shilling flip. You will, of course, include some shots of these people, and also

of those on the other side of the fence about to make their first aerial adventure in the company of an amused pilot.

"Last scene of all" should be an impression of the aerodrome at dusk, when the great lights flare out, and the coloured signals flash, and aeroplanes with red and blue lights on their wings, turn again into the darkness like jewels.

## Music for Your Evening Displays By "COMPUR."

This article stresses the fact that films do not go easily with just any kind of music. The music, and indeed any form of sound, should strive to blend with the film—to become a further dimension, an integral part of it.

**S**ILENT practice still predominates in sub-standard cinematography—and this, it might be suggested, is all to the good. Yet it has long been recognised that film displays are capable of tremendous improvement by the addition of sound. Back in the early days, for example, before the introduction of "talkies," professional firms engaged special staffs to write up musical accompaniments for their silent productions. These "scores" were then released with the films themselves, local orchestras playing through the same accompaniment at any time or place of showing.

It is not suggested, however, that amateurs should model their technique upon this. In the first place, the music from which these early selections were compiled was restricted to a limited number of stock pieces—Schubert's first B Minor movement being worked to death for the heavy dramatics, whilst the characteristic pieces of a well-known coloured composer suffered an equal fate for the lesser emotions.

Now the effect of using such easily recognisable tunes was to divert the attention of spectators from the visual images—nor must this fault be committed by the amateur projectionist of 1935.

### An Essential Need.

The need to-day (in amateur and professional fields alike) is for an effective accompaniment that will not set audiences off whistling or humming after the manner of pre-"talkie" selections. And this having in mind the dreadful thoroughness with which radio broadcasting has familiarised us with most compositions in nearly every class, is apt to take a bit of filling.

Obviously, the best solution to the problem lies in using (a) the less familiar movements of classic compositions, and (b) extracts from newer works that have not yet become sufficiently well known to inspire unwanted interest.

### Practical.

Amateurs who are somewhat favourably situated can, it is true, obtain the assistance of a few skilled musicians capable not only of assisting in the compositions, but also of playing them through special performances. Professionals, indeed, show a growing tendency towards the adoption of this practice, several smaller presentations of the Film Society and the symphonic "Dood Water" (which subsequently earned a season at the Academy) being built up in this way.

But the majority of amateurs cannot count on this valuable assistance. Even where they are able to compose suitable sound-scores, they have still to overcome the difficulties of presentation—and there is little doubt that the electrically amplified gramophone represents the best proposition for the enthusiast whose facilities are only ordinary.

Failing the possession of an amplifier, results better than none at all may be obtained from efficient gramophone reproduction.

### Records.

Records may be played to private gatherings without need for the payment of royalties or special fees—and this means that all or any records may be used to keep the standard of technical execution as high as possible.

Mention has already been made of the need for avoiding hackneyed or stereotyped compositions, and it is

now possible both to qualify and to amplify this. I say qualify, because in W. E. Dick's remarkable scenario for "Primrose Path"—the manuscript of which has just passed through the writer's hands—quite a lot of use is made of a very hackneyed tune called "What'r you gonna do when love comes?" Now in this case the selection is exceedingly good. For Dick wishes to stress the hackneyed nature of the theme he is dealing with. And he successfully relies upon this patience-trying tune to help him out.

Actually, this tune becomes part of the film itself—which is just what every amateur accompaniment should aim at being. There should be no awareness that the music is "just something going on at the same time as the film." The music, and indeed any form of sound, should strive to blend with the film—to become a further dimension, an integral part of it.

Mention of other forms of sound immediately suggests effects. Now there is an extremely good variety of effects records available, and many of these can at some time or other be successfully used as film accompaniment. But not in the "direct" method favoured by the professional cinema—which thinks it is necessary that we should both see and hear the victim being murdered. Rather let us develop a technique in which sound can create independent images simultaneously with the unfolding of the visuals.

Murder your victim if you like—there are some amateurs whose taste still runs to it; but don't do it with revolver effects as well as with the camera. Cinema film costs a frightful lot of money...

## "The Cinema in School"

**T**HE value of the film in the classroom has long been endorsed by the leading schoolmasters of the day, but the technique of intelligent teaching with ciné apparatus with its vast resources has yet to be fully mastered in this country, to derive the greatest possible benefit. Teachers who have not themselves been taught by the ciné camera are in the best position to appreciate the many pitfalls that beset the would-be ciné pedagogue, and should welcome a new handbook by W. H. George who is a teacher of many years' standing and also a sound ciné technician.

Throughout its nineteen chapters it is safe to say that the author has not missed anything connected with ciné education. From the teacher who wants to know about the child's reaction to the film, to the man who wishes to make

his educational films, this book covers the entire ground.

The author has much more than a superficial knowledge of ciné education. His psychological experiments and conclusions with children of all ages, in their likes and dislikes, their outlook, and the ultimate effect of this new form of memory training are highly interesting and of real practical use. His analysis of the films, both silent and sound-track, that are most suitable for children of different ages should be helpful and save much unnecessary expense and trouble.

Fully illustrated with photographs and diagrams and appended with a glossary of technical terms, this book is recommended to those who wish to derive the best out of their ciné teaching.

It is published by Pitman, 3s. 6d. net.

# Letters to the Editor

*The Editor is not responsible for the opinions of his correspondents.*

## TROUBLE WITH ROLL-HOLDER.

SIR,—Your correspondent's trouble is a fairly common one with roll-holders and is due to the axes of the two reels not being parallel, this causes the film being wound on the empty reel to crowd on one side and pucker and buckle the film so that it does not lie flat in the holder.

This is the reason why makers of cameras with large-aperture lenses, where focussing is very critical, advise the use of plates.

It would be worth while to scrap a film of the make generally used and try same in the roll-holder in daylight, and see that the film lies nice and flat when being wound with the slide withdrawn.

The reason why distant views are out of focus and close-ups not affected is that focussing is more critical for distant views, and the small amount of deviation from a true plane does not affect the definition in close-ups so much.

The remedy is to alter the side plate carrying one of the axes so that the two reels are parallel.—Yours, etc.,

W. E. LYON.

## "THE GENESIS OF AN EXHIBITION PICTURE."

SIR,—Although it is difficult to judge a picture from so small a reproduction as a whole-page in "The A.P. & C."

I cannot help thinking that Mr. G. L. Hawkins has gone to a great deal of trouble to produce his final effort, "Copper Beech and Silver Birch." In fact, I would go so far as to say that the final picture does not warrant all this effort. I am not one of those misguided workers who, simply because he is not clever enough to do likewise, will deplore so much drawing on a positive; but when it comes to adding foliage that did not exist, and which, I feel sure, must be evidenced as handwork in the large original, then it becomes neither a drawing nor a photograph.

At the same time, I must confess that Mr. Hawkins has produced a wonderful result from what appears to be a very bad original negative. Each one to his taste; but was it worth the effort? It would have been so much simpler to have again visited the locality on a suitable day, and got the whole thing in the negative by the use of a suitable plate and filter. Getting one's impression into the picture by means of handwork is O.K. by me. In fact I do this myself, for the camera cannot do so. I would not waste valuable time on a negative which would not give a good enough print without having to doctor it with transparencies, and handwork thereon.

But what I really set out to say was, let us have more of these articles giving information as to how certain pictures were produced. Mr. Hawkins is to be thanked for the candid notes on his picture, and I, for one, have learned several valuable hints. The mere fact that the original and worked-up example are reproduced together, shows the aspiring tyro how his efforts can be converted from mere records into pictures.—Yours, etc.,

CLARENCE PONTING.

## THE WEEK'S MEETINGS

### Wednesday, October 16th.

Bethnal Green C.C. "Contact Printing." G. Wright.  
Birkenhead P.A. Criticism of Competitions.  
Birmingham P.S. (Ciné). Talk on Sets in Amateur Photoplays. A. G. Greaves.  
Brighton and Hove C.C. Programme of Talking Pictures. (Wintersgill & Co.)  
Bristol P.S. "Eyes and No Eyes." C. L. Clarke.  
Croydon C.C. "Magic in Trees." Richard St. Barbe Baker.  
Edinburgh P.S. "Rudiments of Sub-standard Ciné Photography." J. S. Dunlop.  
Handsworth P.S. Discussion on Members' Problems. A. H. Pinfield.  
Northallerton and D.P. and C.S. "Gaslight Printing." (Johnson & Sons.)  
Partick C.C. "A Talk on Lenses." J. M. Cuthbertson.  
Rotherham P.S. 46th Annual Exhibition.  
S. Suburban and C.P.S. Lecturettes by Members.  
Worcestershire C.C. "Lantern-Slide Making." Fred Green.

### Thursday, October 17th.

Armley and Wortley P.S. "Wild Life of Meadow and Wood." A. Gilpin.  
Ashton-under-Lyne P.S. Lantern-Slide Making. Demonstration.  
Aston P.S. "Table Top." By Members.  
Barnsley P.S. Annual Dinner, Royal Hotel.  
Birmingham P.S. (Instructional Section). Invitation Evening.  
Bury P.S. "Kirkcudbright." T. B. Howell.  
Camberwell C.C. "Tower of London." W. Tyler.  
Cardiff C.C. Landscape Competition. Criticism.  
Gateshead and D.C.C. Portraiture (Working Night). Members, bring own cameras.  
Hammersmith H.H.P.S. "The Zoo." F. W. Bond.  
Hull P.S. Portraiture—Practical Work. R. E. Booth.  
Keighley and D.P.A. Y.P.U. "On and Around the Cotswolds." E. S. Maples.  
N. Middlesex P.S. "The Dead Cities of North Africa." Major C. Howard.  
P.S. of Ireland. Special General Meeting. Opening of Society's Clubroom.  
Richmond C.C. Lantern-Slide Making Demonstration. P. A. Belcher.  
Wimbledon C.C. "Development—How and How Not." J. A. Drake.  
Woolwich P.S. "A Wanderer in Ceylon." A. L. Fairbank.

### Friday, October 18th.

Bethnal Green C.C. Practical Work.  
Colne C.C. Ciné. "Round the Coast of England." E. S. Maynard.  
Harrogate P.S. Quality in Bromide Prints. (Y.P.T.U.) John P. Oakes.  
Huddersfield N.P. and A.S. "Pictorial Work with an Enlarging Lantern." H. G. Grainger.  
King's Heath and D.P.S. Members' Slide Night.  
Leigh & L.S.P.S. Home Portraiture. W. Whitworth.  
Leytonstone and Wanstead C.C. One-Man Show. L. V. Jessop.  
Newcastle and D.A.C.A. Dance.  
Photomicrographic Society. Short-Focus Anastigmat Objectives. A. E. C. Smith.  
St. Helens C.C. Exposure and Development. M. Bunney.  
Shropshire C.C. Enlarging Night.

### Saturday, October 19th.

Accrington C.C. Social.  
Desborough and D.P.S. Competition—any Subject.  
Hackney P.S. Outing—the Forest.  
Hammersmith H.H.P.S. Criticism of Monthly Competition. G. C. Weston.  
Ilford P.S. London Night Outing.  
Northamptonshire N.H.S.P.S. Autumn Ramble to the Firs and Harlestone.  
Rugby and D.P.S. Bromoil Demonstration.  
S. Suburban and C.P.S. Whole-day Outing to Westerham.

### Monday, October 21st.

Blackpool and Fylde P.S. "Chemicals." R. S. Turton.  
Bradford P.S. "Contact Printing." E. Bottomley. "Enlarging." J. F. Mather.  
Derby P.S. The Midland Counties P.F. Portfolio and Slides.  
Erdington and D.P.S. Discussion Evening.  
Kingston C.C. Colour Filters. (Ilford, Ltd.).  
Lancaster P.S. "Unusual Enlarging." T. Lee Syms.  
Leeds C.C. "Picture-making in the Field with a Camera." Herbert Bairstow.  
L.C.C. Staff C.C. "Table-top Photography." C. Howard.  
Newcastle (Staffs) and D.C.C. "Hither and Thither." P. C. Dutton.  
Oldham E.P.S. L. and C.P.U. Prize Slides.  
St. Helens C.C. "North Lancashire Border." G. A. Forman.  
Shropshire P.S. "Old Shrewsbury." H. E. Forrest.  
S. London P.S. "Portraiture." Sam Logan.  
Walsall P.S. "Successful Picture-making for Beginners." E. A. W. Cave.

### Tuesday, October 22nd.

Birmingham P.S. "Pictorial Relativity." F. W. Lawton.  
Blackpool and Fylde P.S. L. and C.P.U. "Lantern-Slide Making." W. Duxbury.  
Grimsby P.S. "Amateur Cinematography." R. Haigh.  
Hackney P.S. "Elementary Photographic Chemistry." L. O. Maskell.  
Halifax P.S. Competitions; Negative and Print to be shown. H. Bairstow.  
Harrow C.C. "London Docks." Kenneth Baker.

Northallerton and D.P. and C.S. Marcus Adams' Portfolio. Criticisms. D. MacLennan.  
Partick C.C. Visit to Mr. W. W. Weir's Studio.  
S. Suburban and C.P.S. "Miniature Cameras." Harold Burdekin.  
Worcestershire C.C. "Cameras of 1935." W. Hodson.

# Readers' Questions ANSWERED

**GENERAL.**—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1." and in every case, without exception, must give the name and address of the writer.

**CONTRIBUTIONS.**—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

**ENQUIRIES AND CRITICISM.**—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a *separate* stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

## Under-Exposures.

I have seen in your journal articles dealing with football photography where exposures of  $1/2000$  to  $1/5000$  sec. are given in order to arrest movement. Using a meter I find that even in fairly favourable conditions the exposure at the same aperture works out at  $1/20$  of a second. Can you explain this wide difference?

F. J. C. (London.)

The advisable exposure indicated by a meter has to be ignored in high-speed work. Good negatives are certainly obtained with exposures that are very much under normal. The fastest sensitive material is used, and very often the developer is one that gives an image with considerable stain, such as pyro-soda with very little sulphite. The negatives are naturally thin, but show sufficient detail to give a print that is satisfactory for the purpose when made with an enlarger on to a contrasty bromide paper.

## Circle of Confusion.

What is meant by a "circle of confusion"? Does it differ from "circle of diffusion"?

Q. B. B. (Walsall.)

The "circle of confusion" is an optical term used to denote the nearest approach to an absolute focus point of a pencil of light. For example, if we were to make an exposure on the smallest possible point of light, the diameter of its true image on the negative would be the diameter of the circle of confusion given by the lens used. Thus, a lens giving a small circle of confusion will give better definition than a lens with a larger circle of confusion. Some of the highly-corrected photographic lenses in use to-day claim to give a circle of confusion as small as  $1/5000$  inch. The two terms of confusion and diffusion mean the same in this case.

## Hypo Solution.

How do I make up a ten per cent solution of hypo?

W. I. (Hastings.)

Place one ounce of hypo crystals into a measuring jar and fill up with water to make ten ounces, inclusive of hypo. Although this is not strictly correct since the crystals in this case are measured by weight while the water is in fluid ounces, it is sufficiently accurate for general photographic use.

## Graduated Filters.

What is the correct position of an adjustable graduated sky filter with regard to its distance from the lens and the placing of the yellow tint?

C. F. D. (Harrogate.)

If a graduated sky filter is placed very close to the front of the lens, the difference of the yellow and clear portions of the filter will not make such a marked division on the negative as would be seen if the filter were placed farther from the lens. The yellow portion should always be placed uppermost when the filter is in front of the lens, no matter if the camera is held horizontally or vertically. The vertical adjustment of the filter varies with the lens in the same ratio of the sky to remainder of subject. For example, if the view-finder shows one-third sky then the yellow portion of the filter should cover the lens by approximately one third.

## Rising Lens Panel.

Can you please tell me the advantages of a rising and cross front fitted to a camera?

L. M. (Westcliff-on-Sea.)

The use of a rising front is to enable you, when necessary, to cut off a certain amount of the foreground and add a corresponding amount to the upper part of the picture. What is called a cross front acts as a rising front when the camera is used the other way round. Our own opinion is that the rising front is a most useful adjunct to any camera.

## Film Reversal.

Is there any method of reversing a roll-film negative into a positive from which to make negative prints?

J. A. P. (Hemel Hempstead.)

No ordinary roll film is suitable for reversal. Your best plan would be to make a negative in the ordinary way, and from that to make a positive on another plate or film. If you use this positive for printing on paper you will get a negative picture.

## Glazing Solution.

Can you give me the formula for a good glazing solution?

J. L. (Lanarkshire.)

The usual glazing solution is 1 oz. of artists' ox-gall to about 100 oz. of water. In this the prints are soaked for a minute or two and transferred straight to the slabs. As we have often pointed out, we ourselves prefer the same treatment with a 10 per cent solution of formalin.

## Ciné Work.

Can you recommend me a book dealing with 9.5-mm. ciné apparatus and technique?

F. J. (Woolwich.)

A book that tells you all you wish to know about 9.5-mm. ciné work is "Motion Pictures with the Baby Ciné," by Harold B. Abbott, obtainable from our publishers, post free, price 2s. 8d.

## Rapid Fixing Bath.

What is the formula used by many photo agencies for a quick-acting hypo solution for both negatives and prints?

E. McK. (Edinburgh.)

The following has been suggested: Commercial sal ammoniac, as used for electric batteries, 1 oz.; hypo, 4 oz.; water, 1 pint. This bath fixes in about half the usual time, but its use is not recommended excepting for emergencies.

## Blocking-out Background.

How can I remove the background from a negative of a piece of machinery, so that the subject appears on a white background only?

K. T. (Letchworth.)

You must cover the whole of the background of the negative with something that is quite opaque. Much of this can be done by means of a paper mask, cut so as to show the machine and its immediate surroundings, and stuck down on the negative on the glass side. Then paint a thin edging all round the outlines of the machine on the emulsion side. Straight lines can be ruled with a ruling pen, and certain parts can be followed with the aid of the fret-cut wood instruments known as French curves. Finally, paint over the spaces between the outlines and the mask. Suitable mediums are indian ink, or (better still) "Photopake."

## Rinsing Negatives.

Why must one rinse the negative in plain water between developing and fixing?

G. D. (Wolverhampton.)

It is not absolutely necessary to rinse the negative if an acid hypo bath is used, since the presence of the acid will neutralise the alkaline that is carried over with the developer in the emulsion. This presence of acid thus helps to keep the hypo solution fresh. Some workers aver that a rinse is always advisable, even though an acid hypo bath is used, as it helps to prevent the formation of grain which is so detrimental to miniature negatives.

## Business Notices

### Publishing

**OFFICES.**—Dorset House, Stamford Street, London, S.E.1. Telegrams: "Amaphot, Sedist, London." Telephone: Hop 3333 (50 lines).  
**PUBLISHING DATE.**—The Amateur Photographer and Cinematographer "is on sale throughout the United Kingdom every Wednesday morning."  
**SUBSCRIPTION RATES.**—British Isles 17/4 per annum, Canada 17/4, other countries abroad 19/6 per annum, post free.  
**REMITTANCES.**—Cheques, etc., should be crossed and made payable to Iliffe and Sons Ltd. "The Amateur Photographer" can be obtained abroad from the following: **UNITED STATES:** The International News Co., New York. **FRANCE:** W. H. Smith & Son, 248, Rue Rivoli, Paris; Hachette et Cie, Rue Beaumour, Paris. **BELGIUM:** W. H. Smith & Son, 71-75, Boulevard Adolphe Max, Brussels. **AUSTRALIA:** Gordon & Gotch, Ltd., Melbourne (Victoria), Sydney (N.S.W.), Brisbane (Queensland), Adelaide (S.A.), Perth (W.A.), and Launceston (Tasmania). **NEW ZEALAND:** Gordon & Gotch, Ltd., Wellington, Auckland, Christchurch and Dunedin. **INDIA:** A. H. Wheeler & Co., Bombay, Allahabad and Calcutta. **CANADA:** Imperial News Co., Toronto, Winnipeg and Vancouver; Benjamin News Co., Montreal; Gordon & Gotch, Ltd., Toronto. **SOUTH AFRICA:** Central News Agency, Ltd.

### Displayed Advertisements

Communications on Advertisement matters should be addressed: The Advertisement Manager, "The Amateur Photographer and Cinematographer," Dorset House, Stamford Street, London, S.E.1. Copy for displayed advertisements for the issue of any particular week must reach Dorset House by the first post on Tuesday morning in the week previous. Rates and conditions will be sent upon application.

### Prepaid Advertisements

#### SALE AND EXCHANGE: AMATEURS ONLY—

12 words or less ..... 1/-  
 1d. for every additional word.

#### PROFESSIONAL AND TRADE:—

12 words or less ..... 2/6  
 2d. for every additional word.

Each paragraph is charged separately.

**SERIES DISCOUNTS** are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid and posted to arrive at the Ad Office, Dorset House, Stamford Street, S.E.1, not later than first post **FRIDAY** for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 260, Deansgate, Manchester, 3; 26a, Renfield Street, Glasgow, C.2.

Advertisements are inserted, as far as possible, in the order received, and those received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

Postal Orders sent in payment for Advertisements should be made payable to **ILIFFE AND SONS LTD.**, and crossed

& Co.

Notes being untraceable if lost in transit, should not be sent as remittances.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

**BOX NUMBERS.**—For the convenience of advertisers, letters may be addressed to numbers at the office of this paper. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charges, which must include the words: "Box 000, c/o 'The Amateur Photographer'." Replies should be addressed: "Box 000, c/o 'The Amateur Photographer,' Dorset House, Stamford Street, London, S.E.1," and these letters will be simply forwarded by us to the advertiser. It must be understood that we do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisement. Readers who reply to Box No. advertisements are warned against sending remittances through the post except in registered envelopes. In all such cases the use of the "Deposit System" is recommended.

### Special Note

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post. When sending remittances direct to an advertiser, stamp for return should also be included for use in the event of the application proving unsuccessful.

### Deposit System

Readers who hesitate to send money to advertisers in these columns may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Amateur Photographer and Cinematographer," both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods, they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in the event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For all transactions up to £10 a deposit fee of 1/- is charged; on transactions over £10 and under £50 the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, one-half per cent. All deposit matters are dealt with at Dorset House, Stamford Street, London, S.E.1, and cheques and money orders should be made payable to Iliffe and Sons Ltd.

## CAMERAS AND LENSES

## WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

## CAMERAS AND LENSES

**LEICA** Model I, non-interchangeable, Elmar f/3.5 lens, perfect order, £8/10.—Tapper, 3, Gordon Place, London, W.8. [9832]

## "TRANSPAROL"

are made of pure "Cellophane" (Reg. Trade Mark), and not cheap imitation material. They are invisible, and show the picture up to its extreme edges. 6d. per box of 100.

*They do not stick together and ruin the snaps like those of inferior makes.*

## "FAVORIT"

are handsome opaque corners, easily and quickly fixed in position. Very ingenious—they make snapshot albums very beautiful—and eliminate the bugbear of messy paste pot and brush. Made in Sepia, Grey and Black. 6d. per box of 100.
